TAPR Hot Technologies Related to APRS Special Interest Group Archive, January 2000 through December 2000

January 2000 through December 2000

TAPR's forum for new APRS-related hardware and technology, particularly APRS-ready radios such as the Kenwood TH-D7 and TM-D700, along with GPS interfaces, cables, firmware, packet operation, satellites, mobile installations, troubleshooting, and operating techniques.

This volume contains 12 original monthly files and 2,895 messages, arranged chronologically. The PDF is a readable access copy: MIME transfer encodings are decoded, HTML bodies are converted to plain text, and non-text attachments are represented by descriptive notes. The raw source text is supplied separately with the Internet Archive item.

1. [htaprs] ADMIN: APRS Hot Technology SIG

From: Stan Horzepa <stanzepa@mail2.nai.net>
Date: Sat, 01 Jan 2000 12:28:22 -0500
To: "TAPR HT APRS Special Interest Group" <htaprs@lists.tapr.org>
Message-ID: <LYR845-57576-2000.01.01-11.42.19--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last year, TAPR created the HTAPRS SIG for discussion of the Kenwood
TH-D7 transceiver. This year, there is a demand for a new SIG for the
new Kenwood TM-D700A transceiver. In response to that demand, a new list
has been created at OneList.

Here, at TAPR, we deicided that rather than start another SIG, we are
renaming the TAPR HTAPRS SIG as the "APRS Hot Technology SIG." HTAPRS
will now be a place to discuss the latest and greatest in APRS goodies
without having to create a new SIG each time a new product is introduced.

So, feel free to use the HTAPRS SIG to discuss the TM-D700A, as well as
any new APRS products that comes down the pike in the future.

73,

Stan, WA1LOU, APRS/HTAPRS SIG Administrator

Rendered body type: text/plain

I have heard of a weather station mentioned on this list, compatable with the
D7A. Where can I read about this unit?

Thanks
ron-kd5hty

Hi from Pete, KD4SPW, In Ft. Pierce, Fl.

     My experience with winaprs 226 and mobile trackers of any kind is as
such:
For me it is quite hard to follow a replayed track of a mobile tracker when
the operator cycles power on/off to the gps unit frequently. Such is the case
of the many operators who drive as a job and stop often or when anyone is out
running short errands. The 0,0 posits create tracking lines to Africa back
and forth for every time the gps unit is powered on again. My D7A does the
same of course.

      I am experimenting with using regular AA alkaline cells in my Garmin
GPS II. I am recharging them using the Rayovac Renewal recharger. This way I
leave my gps on while making stops. Other times I turn the gps off, but leave
the D7A on. The D7A will keep xmitting the last posit from the gps. Then
after gps is turned back on, it sends fresh posit. This usually happens very
quickly, even before I get out of parking lot. The D7A then never sends a 0,0
posit. If I will be stopped for more than A few minutes, I just turn off
beacon on the D7A. Of couse should the D7A batteries die causing the HT to
cycle on/off, it will lose the last posit and start sending 0,0 posits.
I just need to hard-wire gps to car battery, I guess.

So long
from Pete, KD4SPW.

Marc wrote:
<< Peter,
I also have a renewal recharger, and found massive overheating problems recharging regular alkalines. You also have to put a bit of foil on the plus contact to establish the circuit. You are talking about recharging regular alks arent you? Ive found the performance of the rechargable type to be about 150 cycles, with increasing speed of discharge when used in my gps. Once the light won't go out after an 8 hour charge, theyre trash.

Thanks
Marc
<<

New from Pete, KD4SPW, in Ft. Pierce, Fl.
  Marc, 150 cycles of the Rayovac alkaline batteries seems very economical. Yes I have been using standard AA alkaline batteries, mostly those I buy at the Big Lots closeout store. I end up paying about 25 cents each. I feel they probably have much less life than the Copper tops or the Bunny batteries. Bob, WB4APR mentioned in a posting about his holiday trip about the gps not working after the cells drain to an average of about 1.2 volts. For this reason I don't get much recycle life in my gps. When the cells will not hold a high enough voltage, I then relegate them to use in the AA battery pack of my RS HTX 202. Then I cycle the heck out of them on receive only, as I carry it around the house listening to 2m repeaters.
  Since the plastic or mylar like wrapper at the + end of the batteries prevents their charging in the Renewal unit, I take an exacto or sheetrock cutter to slice through the wrapper. Then I peel that very top part off. I get nowhere near 150 cycles. Also the cells like to be recharged early on before they discharge much. The instructions with the chargers say much longer life will be realized from the cells if they are charged after each use before they discharge much. I have tried the Buddy L charger sold a few years ago with poor results. Just before Christmas while doing my 2:00 a.m. shopping at Walmart, I noticed a new Rayovac Renewal charger. It states that it will charge the Renewal batteries along with Nicads and Nickel Metal Hydrides. This probably means that they have changed the + charge terminal. It may no longer require the removal of the end of the wrapper surounding the tip.

Sorry to run on so long, but I thought others on the sig might be interested in another battery alternative.

Pete, KD4SPW.

5. [htaprs] TM-D700 great TNC/Radio combo

From: David Cook <dacook@cityscape.net>
Date: Sun, 02 Jan 2000 01:20:23 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-57696-2000.01.02-01.36.33--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hot Tech. Sig:
     Kenwood's TM-D700 works well hooked up to a PC com port. The cable
is available at Radio Shack; I needed a cable with 2 DB-9 female
connectors (straight wired, not a null modem cable) for $10. A familiar
TNC initialization screen appears using a terminal program. Set the
terminal program or packet program to com port speed 9600 bps (the TNCs'
default). You must select [F] (1 s), [TNC] until "TNC PKT" is displayed
at the top left on the radio display. Enter your callsign in the MYCALL
TNC command (MYCALL KB9OQL). Use the "HBAUD" TNC command to switch from
1200/9600 baud packet radio capabilities. With the 2 meter power
settings, you've got a 5/10/50 watt packet station. I haven't tried
this yet, but I'm sure my Palm III will also plug in (using the Delorme
Tripmate GPS cable) to the serial cable I bought to run a terminal
program for mobile packet operations.

Make sense for APRS to ignore 00 posits clearly.

I leave the GPS running for short stops, but not for longer ones and
since there are lots of trees and hills here it can take five mins
to get a sync once I drive off (esp in rain) so I guess that puts me
in the sea too....

>   I am experimenting with using regular AA alkaline cells in my Garmin
> GPS II. I am recharging them using the Rayovac Renewal recharger. This way I

I aim to put a 12v smoother and 7v reg in the same 12v plug - and run the
GPS and 3w tx from the same lead... with a switch to disable the TX
power as I really hate driving into petrol stations with a beacon set
and if I power down, I get a TX at the pump when I switch on again...oops..

> I just need to hard-wire gps to car battery, I guess.

Or switch the GPS-Radio line and only enable it when you have a fix.

Rendered body type: text/plain

I don't know if anyone else ran into this, but I noticed the Renewal AA
cells seem slightly smaller than the other AA cells. I used to use them in
my Magellan GPS because it really eats them up, but one day, a new set I
bought seemed to slip in just a little too easily, and it wouldn't stay
on. All the ones I bought since then have this problem. The regular
alkalines are fine.

8. [htaprs] A friendly suggestion for quoting long messages

From: Ralph <rwf@bsrg.org>
Date: Sun, 02 Jan 2000 09:52:37 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Rendered body type: text/plain

It is always best to quote as little as possible, but an additional form of
"Netiquette" is to write your response ABOVE any messages you are quoting.
They would be ever so much easier to read- especially when the writer feels
that he has to completely quote additional previous messages. With the
heavy traffic on all these APRS SIGs, it really makes it hard to read all
messages (which I still do) when someone wastes so much of our time making
us dig for the meat.

A lot of folks can preview the first 10-20 lines of a message, too. If the
meat is in the beginning, we can even keep from having to fully open the
message, too! Thanks!   Ralph

To test your new radio at 9600 baud, you will get 16 passes a day from
these satellites, all sending continuous 9600 baud data.

UO22, KO23, KO25, TM31

>From a mobile antenna you should be able to get a few minutes of data
during the center of the pass when the satellite is above say 30 degrees.
(But not from a base station due to coax loss).

These satellites make excellent 9600 baud TEST signals.. anywhere on the
planet... With a small handheld beam (3 elements or so) you should be
able to get packets from horizon to horizon...

Bob, WB4APR

Mike asked for my opinions on the new Kenwood relative to should he
upgrade from his THD7. Of course, everyone's needs are different, but
here are what I see as the key points in the comparison:

1) The software is mostly identical. Even Menu's are similar
2) D700 has 50W. (Thats 10 dB over the HT. Good for mobiles)
3) Has 5 set ups, so you can set 5 POSITS and STATUS texts (one for work,
home, boat, travel, etc) But if you use GPS, then your posit is always
valid anyway... But I use the HOME, WORK, and COMMUTE posits so I dont
have to have a GPS running for 95% of my travels... (My inability to keep
a GPS working in my mobile is a personal problem, not yours...:-)

4) Has packet MONIOTR display so you can see EVERY packet. Nice for
reading the mail. (But it is just a RAW display. It doesnt capture
other peoples messages specifically, just displays all packets.

5) The 9600 baud will be GREAT for satellites, once we figure out how to
use it..

6) ALL info about a station is shown on 1 screen instead of 5 in the THD7
7) Lower case alphabet is easier to enter in messages
8) Can digi for RELAY, WIDE and TRACE (Pse disable W and T usually)
9) SHows time-of-receipt for messages
10) Can receive MESSAGE and BULLETIN groups
11) Flags un-read messages
12) You can now DELETE messages
13) You can enter degrees of position ambiguity
11) Can output 6,7,8 and 9 character Waypoints to GPS units that can
    accept the longer length. Thus, full calls can be displayed

But you cannot carry it in your shirt pocket.... Im sure I left
somethings out. But these are the ones that come to mind...

De WB4APR, Bob

Wondering about a couple of basics, to see if could replace stand-alone
tracker in the XYL's vehicle:

  - Does packet work in background? For instance, set 2m/440 to normal
voice channels but packet to 144.390 and have packet xmit/rcv without
intervention?? Some kind of hold-off so does not transmit packet while
voice being received or transmitted?

  - Semi-off mode? Where display is off but APRS packets still get
xmitted?? (so still useful when xyl doesn't turn radio on, or vehicle is
stolen)

  - Crossband digipeating between 2m/440?? And still useable for
regular voice?

Thanks in advance,

Mark/K3RAM

Rendered body type: text/plain

First I will assume that if you are using a GPS, you are moving which
usually implies a vehicle with a battery. Why not spring for the cigarette
lighter adapter and save yourself a lot of hassle? If you are in a 'must
use' AA mode, hiking or bicycling, go to Sam's and buy one of their 20 packs
of AA's, usually very reasonably priced and very fresh. An extra 4-pack
takes very little room.

I am a professional photographer and when I was doing weddings I would
change out all of my batteries before each wedding (cheaper than a law suit
or redoing a wedding). Early on I tried the rechargeable route and ended up
with a very unreliable situation. I gave the whole mess, about 50 batteries
to my grandkids for their toys. I then used the slightly discharged
batteries from the weddings for my radios and GPS units.

The first Garmin cable I had was just a Garmin to DB-9 and we would often
have the GPS batteries run down about the middle of a trip. I would then
have to talk my wife through replacing the batteries, restarting the GPS,
and restarting Street Atlas as I tried to keep the motor home on the road.
The cable with the serial adapter and cigarette lighter adapter has saved
many a harsh word. In normal operation, (we travel a lot) I will change the
batteries about every two months unless I forget to turn the GPS off...

Beware... Garman also has a cable with the cigarette lighter adapter and the
data lines are without the DB-9. Make sure you order what you want. I had to
go directly to Garmin...

Rendered body type: text/plain

Good evening , and a Happy New Year, been playing around with my D700, got everything working except the 9600 baud in non APRS tnc mode. There is a minor bug in how icons are sent out in GPS or non GPS mode, with some APRS S/W. (Attached message/reply from WinAPRS/MACAPRS author). If you do a disp with a pc running a terminal program you can see the command set. A command list appears at the end of this message. The configuration menu doesn't configure the tnc for 9600 baud in non APRS tnc mode. What you have to do is, from the command line enter a hbaud 9600, and bingo your in 9600 baud ! Also going to set fu on . Going to try to post a short message on KO-25 tonight running WiSP on my laptop, using the vertical mobile antenna on my truck. I will post my results here on the SIG.

73 Jeff kb2wqm

I think this is a problem on our end and will be fixed shortly.. We
have to be able to duplicate it though.. It is a tough one..
However, we have seen some problems with the MicEncoder data not
being translated on the internet correctly, so that could be part of
the problem..

17. [htaprs] Garmin eTrex & TH-D7A

From: "Steve Sande" <kc0ezh@arrl.net>
Date: Sun, 2 Jan 2000 17:23:12
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-57804-2000.01.02-17.40.01--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone successfully (or otherwise) interfaced a Garmin eTrex with a
TH-D7A? The eTrex is inexpensive ($119.95 through www.thegpsstore.com),
small (2" x 4.4" x 1.2", 5.3 oz.), has good battery life (22 hrs from 2
AAs), and looks like it can withstand some rough handling. Specs say it has
the following interfaces: RS232 with NMEA 0183, RTCM 104 DGPS data format
and proprietary GARMIN. Likewise, Garmin has also released the eMap, which
is a bit larger, heavier, more expensive, but has a really nice moving map
display.

Happy New Year to everyone!

> response ABOVE any messages you are quoting...

Seems like this topic surfaces every 6 months or so.
I prefer the typical english language approach,
comments get tacked onto the end of the previous comments.

Here's a quote from the TAPR SIG FAQ at
http://www.tapr.org/tapr/html/Frfc1855.html

   "If you are sending a reply to a message or a posting
    be sure you summarize the original at the top of the
    message..."

Note the suggestion to summarize at the top.

Now, all that said, I agree with Ralph 200% on the
snip for brevity issue.

Also from the TAPR SIG FAQ -

   "...include just enough text of the
    original to give a context...
    Giving context helps everyone. But
    do not include the entire original!"

I have found that using the subject line of the message works as I can go
back and see the subject lime to read the original text, but then again I
use Outlook Express and can do a search for specific text as well and save
all the mail that comes my way as well, but I am a pack rat by nature. I
save all my mail in different folders and I know it is taking up disk space
but what the heck.

The problem I had with the regular alkiline was Ineeded to carry fifty pairs to keep up with the Divison
 of Wildlife in the camping and surveying projects. This was solved with the Ni-Hy batteries and a solar
 charger. The solar charger I ordered from U.S. Cav . The Maha chargeralso runs off 12 volts as well.
  Mahas charger . I have both to be able to run in the woods or mobile.
But a power cable is nice too

Yes, it can.

I just got mine, and I'm wondering if it can be programmed by a PC.

Maybe I should try the D7A software :)

The Garmin eTrex works with the TH-D7A pick up one for $119 from Office
Depot the other day.
Had to Order a pc cable off the internet. wired a DB9 to TH-D7A adapter
used NNEA on the eTrex
and every thing worked just fine.. I could not find the data cable with just
wire ends hope to soon it would be cheaper.

You can also buy a set of Energizer Lithium primary cells for this battery
pack, These cells are rated at 2,600 mAHr and will work at very cold
temperatures and have an extremely long self life.

Hummh... I didnt see it that way. I saw it as a name change with the
intent of making it a list for both Kenwood radios. And just changing the
namedefinition was the easy way so that all existing subscribers didnt
have to do anything to be subscribed. We'll see.. I guess...

Howdy all and Happy New Year,

Well, I was (and still am slightly) sick all of this past New Year's
Weekend. Yup, watched the festivities Friday night flat on my back! So

needless to say, I didn't do a whole lot of playing with the TM-D700.

I did manage to find a quirk though and I know Kenwood reads these lists, so an answer from them would be great.

The TM-D700 has several standard posit comments such as "Returning", "Off Duty", "Priority", "Emergency", etc. It also has six custom comments labeled "custom1" through "custom6." The problem is that I can't figure out how to customize the custom fields. The specialized communications manual included with the radio makes just a passing footnote comment about these that they are "user programmable." However, nowhere in either manual are instructions given on programming them.

Is this a firmware step Kenwood forgot? And if it is, will I need to send the whole radio in to Kenwood or will they make it user upgradeable?

For a guy just driving around town, the standard posit comments are a little goofy. I'd like to be able to set my own. Does anyone know how to do it?

Thanks es 73,

Jon

Bob -

Yikes! Convert ASCII to DTMF so it can be converted back to ASCII???
You're right --- it wouldn't be "perfect." In fact, it sounds pretty convoluted!

Wouldn't there likely be a more straight-forward way; say, through the serial control/tnc port? What about a PIC to go from PC keyboard to RS-232? And maybe a couple of buttons or keystrokes to select TNC packet or APRS modes, maybe even a rig control mode to set menu items and enter memory presets. Heck, you could implement a complete outboard control system that pasted prompts right on the D700's display.

If you're going to use an external processor to augment the control functionality of the TM-D700's processor and software already running in the radio itself (which sounds kinda goofy as it is...) why not go all the way?

This probably sounds a little flippant or like a flame, but that's not my intention. I'm just thinking out loud. The D700 is somewhere between a radio with built-in TNC and a full-blown mobile data terminal (MDT). What I think you're proposing is the use of a "black box" to fill in the missing pieces.

I'm not opposed to that idea at all. It's just a shame we can't tap the internal processor already in the rig. Perhaps someday a manufacturer will allow room for loading and running custom macros in the rig, or a sort of "KISS" mode to allow complete outboard control of the radio using API's.

Sort-of like the Kachina version of a dual-band FM radio...

73's and Happy New Year!

You should be able to get the cable direct from Garmin assuming it is the
same as the other Garmin units..... Ain't cheap though...

Subject: [htaprs] Garmin eTrex works

The Garmin eTrex works with the TH-D7A pick up one for $119 from Office
Depot the other day.
Had to Order a pc cable off the internet. wired a DB9 to TH-D7A adapter
used NNEA on the eTrex
and every thing worked just fine.. I could not find the data cable with just
wire ends hope to soon it would be cheaper.

Subject: Garmin eTrex & TH-D7A
From: "Steve Sande" <kc0ezh@arrl.net>
Date: Sun, 2 Jan 2000 17:23:12
X-Message-Number: 13

Has anyone successfully (or otherwise) interfaced a Garmin eTrex with a
TH-D7A? The eTrex is inexpensive ($119.95 through www.thegpsstore.com),
small (2" x 4.4" x 1.2", 5.3 oz.), has good battery life (22 hrs from 2
AAs), and looks like it can withstand some rough handling. Specs say it has
the following interfaces: RS232 with NMEA 0183, RTCM 104 DGPS data format
and proprietary GARMIN. Likewise, Garmin has also released the eMap, which
is a bit larger, heavier, more expensive, but has a really nice moving map
display.

Happy New Year to everyone!

73s,

KC0EZH, Steve Sande

Hummh... normal everyday AA Alkalines are 2,700 mAH and have a 4 year
shelf life....? So it seems the only advantage of the lithium's are their
cold temperature performance?

> how to customize the custom fields. The ... manual...says ... these
> are "user programmable."

*** They should have used the term "user definable". The custom messages
C0 through C6 are just that. "C0" through "C6". The user and his
recepient must agree apriori what they mean. This was
intentioally NOT made user "programmable" because the potential for
the sender and receiver to have different definitions as to what they
meant would lead to on-air communications errors.

The intent of the CUSTOM comments are for personal use. IE, you and your
wife agree that C1 means "You pick up the kids", or C2 means "take out the
garbage", or in your club, C6 means "call me"...etc...

If you think about it, any attempt to allow firmware definitions would
lead to a tower of Babble and no one could ever trust the intent of the
sender... Leting C1 simply mean "C1" is the only way to assure that this
ambiguity is not missinterpreted...

Maybe you can convince Kenwood to do a re-design. But in the meant time,
what we have is a radio that accepts MESSAGE TEXT entry from the Mic
TTpad.

OK.

One thing I forgot to mention is that when I first powered up the rig and
started it on APRS, I set the posit message to C0. I got an e-mail from a
guy who told me that I was sending EMERGENCY packets. I wasn't, but yet
they were showing up that way.

Any ideas?

73,

Jon

Wow. Find out what version he was running. THese CUSTOM messages are
brand new and not all software may have caught up with implementing them
correctly...

I don't think a re-design is needed as i asume that the tm-d700 can be
controled true the serial port like the th-d7 i'm not sure if messages can
be programed via rs232 but memory names and a lot of other things can, has
anyone atached it to a computer yet and typed a AI to test the rig control
mode.

THD7 is/was cutting edge certainly, but one or two niggles.... it seems
very sensitive to interference from non ham broadcast, and digital type
noise from PCs- Im always having to adjust the squelch on 2 and 70 fm (Ive
never had interference on 70cm fm before)

The TNC can do some strange things too - a local ham here finds that
the THD tnc locks sometimes (not when central locking, but when
deadlocking the car oddly) but the other day beaconed a location
with his callsign split by a CMD:

as in GCMD:0TQ   <-except it was his call, not mine.

Hope the mobile is a bit more robust... put a decent antenna on
and problems could get worse?

Im still pleased I bought it of course...

Wishlist:

flash upgradable ROM
Several POSition 'memories' (I gather the mobile has this?)
Activating the TNC should disable battery saving on that band.
Option for backlight to come on when TNC packet received.
Alarm could be selective as to monitoring APRS packet origins
Digipeater function
Speech syth giving callsign, range and direction (ok ok I'll stop now)

:)

Might be. I thought that normal AA Alkaline were only 2,200 mAHr but since
there seems to have been improvements in them recently maybe they are that
good now. BTW, for what it's worth the Lithiums are also extremely light
weight ... and expensive.

Probably many of you have by now seen ads for the Motorola 2-way
pager
unit (sorry, I didn't memorize the name). I've seen it in every issue
of Time
magazine for the past month or so.

There's a LOT of stuff inside this box that sure is inspiring for the
future of
handheld two-way comms, makes you wonder if one could be adapted to
APRS with the deft application of a soldering iron and screwdriver:

Palm Pilot sized graphical screen (one ad showed a map in the
display);
Palm Pilot sized footprint;
2-way radio packet type radio;
Full QWERTY keyboard (how long before 3COM catches up?).

Maybe it might require a wholesale stripping out of the RF and packet
formatting circuitry, but boy what a user interface for a pocketable
box!
Kenwood ought to talk to these guys, a special terminal-only version
would make the D700 really sing.

73,
Tony KD7CEJ

Rendered body type: text/plain

New Year's Greetings to the SIG:

I have had my TH-D7A/Palm V combo operational for one month,
now, and I have "had a ball" discovering its capabilities.
As a new user of these two "toys" I found this sig (AND the
sig's ARCHIVES) to be invaluable for the little hints that
everybody discovered on a daily basis - hints that NO manual
could begin to cover.

It is with this in mind, having seen newcomers added to the
sig on a regular basis, that I would like to mention the
following points that I don't see discussed too much in
detail:
        -besides the obvious use as a small portable APRS system,
         this combination can be a great regular packet unit.
         Simply search the net for "ACCESSIT!", a terminal
         program that makes the neatest comms device if you
         like small things (and no reliance on MaBell).
        -hook up any external modem, a phone line, use a
         downloaded programme called "PROXIWEB" (again, do
         some surfing/searching on the web), and dial your
         ISP to get easy (albeit small) access to almost
         all of the I'net.

Now, these two or three items CAN be stowed in a pocket and
one
is truly portable in his COMMS; however, I can hardly wait
until I get my D700.

Yup.. the Pagewriter 2000 (and 2000x). I use one at work every day.

A similar device that ran over APRS and had a bidirectional smtp gateway
would be a "killer (ham) app" IMHO.

>SInce you can do everything from the serial control port anyway... right?

Can you power on the radio from the serial control port? I don't see
how. The only switch I find on the main unit is the reset button. I
guess you can only power up the unit from the control head, so unless
you area able to hack the hardware, you can't completely control the
radio from the serial port :(

Then again, leave the control head attached to the radio, power up
the radio, lock up the whole assembly in the trunk, and run the
microphone, speakers and serial line to the passenger compartement.

I suppose it's also possible that he was seeing munged packets if he
was watching on the net.

It looks to me like the aprsd software still doesn't unpack Mic-E packets
properly.

Rendered body type: text/plain

GREAT NEWS!

The one thing I missed while using the THD7 was the APRS TRAFFIC page
where you could "read the mail" and see who is talking to whom. I had
asked for this capability in the TMD700 on the PKT-MONITOR display...
but it apparently didnt make the cut...

Today I got a tip from Kenwood that you CAN DO IT in the TMD700!

Just enter the WILDCARD "*" as one of your MESSAGE GROUPS.

Then ANY traffic to ANYONE will be captured in your MESSAGE list. AND it
shows you what "GROUP" you captured, so you can SEE who the message is
really to. Thus, while you are traveling far from home, you CAN entertain
yourself by reading the mail..

THANKS KENWOOD! Great Feature!

Rendered body type: text/plain

All,

I found a solution for those of you like me who prefer a button type mount
for the TM-D700A's microphone (as opposed to the "hook").

Go to Best Buy and purchase a thing called "The Tab Kit." You'll find it in
their cell phone accessories section. It costs about $2.00. It is made by
the Clip Company (www.theclip.com). The "tabs" or "buttons" are designed to
go on cell phone swivel clips, but will work fine for our application.

The button attaches to the mic by double stick tape. Apply and let the tape
set and VIOLA! you now have a mic that mounts with a standard mic holder.

OK siggers,

Another thing to watch for when hooking up extension cables for the mic or
control head on the TM-D700A:

If you go out and buy an 8 wire modular coupler and a standard 8-wire
category 5 cable and hook up the microphone, it won't work. I tried it.
You need an "extension" cable. I've not seen them in Twisted-pair-shielded
cable but just in flat cable. The standard cables always connect pin one to
pin one. If you draw it out, that won't work. What you need is a cable
where pin one on one end is connected to pin 8 on the other and so on. It
needs to be flipped.

If you doubt me, draw it out. It makes sense. And I tried it. It doesn't
work and tomorrow I'll end up making my own extension cable.

I think this is a peer to peer cable which basically is equivalent to a null
modem cable in the RS-232 world. The TX and RX lines are swapped. So I
don't think this would work either.

I think the problem people are running in to is that those el cheapo RJ45
couplers are wired _straight_ thru. In otherwords, 1->8... when you really want
1->1 (think mirror image). So people then compensate for this with the cable
they make.

As you point out, these (ethernet) cables don't help since they're 1,2 -> 3,6
(and vice versa).

this combination can be a great regular packet unit.
 Simply search the net for "ACCESSIT!", a terminal
 program that makes the neatest comms device if you
 like small things (and no reliance on MaBell).
hook up any external modem, a phone line, use a
downloaded programme called "PROXIWEB"

> yes but would you still need Ma Bell for the phone line!

Wouldn't you?

Jon -

AAaarrrgghhh! This has been the curse of the modular cord since the day
they were introduced to the telephone industry by Western Electric back
in the early 70's!

You will find that most "telephone" cords (like the flat "silver satin")
type you mention, "flip" the plugs on each end of the cord, so that both
spring tabs are on the same side of the cord. This is the original
manufacturing design by Western Electric and has caused countless
confused moments as telephone installers try to trace conductors through
a telephone cord and the jacks it plugs into on each end. Lay the plugs
side-by-side with both tabs up and you see that the conductors are
reversed from plug to plug.

This is even more perplexing when you throw a modular cord coupler
between two cords. Some couplers reverse the jack wiring to compensate
for the second reversal of the extra cord, some do not.

In the data communications industry, this nonsense has been abandoned;
and all cables, couplers, and jacks are manufactured so that the
conductors never change position. Thus, Ethernet 10base-T and category 5
100baseTX cables do not reverse the conductors through the cable. (The
exception is special "cross" cables used to connect one hub to another;
but they reposition by pairs, they do not reverse all the conductors as
a telephone cord does.)

Originally, the data industry used a small protrusion on one side of the
plugs as "keys" to prevent the "non-standard" data cables from being
inserted into "normal" telephone jacks. Many jacks designed for data
communications still bear an extra little slot on one side of the
opening to accommodate the keyed data plugs, but you seldom see them in
use these days.

Why any manufacturer outside the cursed telephone industry would choose
reversing cables over straight is beyond me, unless Kenwood was allowing
the use of off-the-shelf telephone cords to extend the D700 control
head. But in 8-conductor cables, I would bet Ethernet cables are found
"off-the-shelf" far more commonly than telephone cords. And with a price
tag in the $80 range, Kenwood must have thought their separation cable
was pretty special too.

73's and Happy Y2K!

Mark -

Sorry, but it won't. See my post earlier re: this topic.
A "crossover" cable switches the transmit and receive data pairs from
end to end, it does not reverse all 8 conductors. Here are a couple of
tables to compare:

8-conductor USOC Telephone cable
1 <--> 8
2 <--> 7
3 <--> 6
4 <--> 5
5 <--> 4
6 <--> 3
7 <--> 2
8 <--> 1

8-conductor Ethernet cable
1 <--> 1
2 <--> 2
3 <--> 3
4 <--> 4
5 <--> 5
6 <--> 6
7 <--> 7
8 <--> 8

8-conductor Ethernet "crossover" cable
(courtesy Black Box catalog)
1 <--> 3
2 <--> 6
3 <--> 1
4 <--> 5
5 <--> 4
6 <--> 2
7 <--> 8
8 <--> 7

I hope this "straightens" things out...

73

Good question. APRSdos will display "D-700" on the POSIT and the STATUS
and LOG pages, so it might not be necessry. So I think -7 is still fine,

but I agree with youu also, that when I have both on the air, that I will
probably use -8 for the D-700.

> 2. how do you set the MYA for digi'ing on the D700 without a PC?

APRS MENU under UIDIGI. But Pse only use RELAY, unless you are on a
mountain...

Call me a maverick, but I use -1 for my TM-D700 now and -2 for my TH-D7A.

Also this somehow caused my position to be wrong through some igate's.I
would really like to run with the Mic-encoding turned off. False emergency
alarms from scrambled packets etc, will water down the emergency function.
I don't think it's needed by me to ride around off duty 99.99 % of the time!
I don't see how it can be turned off though, but I think it need's to be,
for general amateur use....

Having been there, done that, and let the smoke out on my Yaesu FT-8500, all
I can say is:

"BE CAREFUL!" (Shouted with a most parental tone of voice. ;-)

I failed to double-check a cable and smoked a 9V regulator in my '8500 by

stringing a collection of cables/couplers (OK, two cables and one coupler)
together that reversed the pin order.

Had I designed the radio, I might have used an 8-pin connector, and left the
mirror-image pins for power and ground connected to *nothing*, so the worst
that would have happened in my case would have been a non-functional mike.
C'est la guerre...

Maybe Kenwood did this and you've nothing to worry about.

Hi all

In the Netherlands we use -7 for portable stations and -9 for car mobile
stations (-15 for planes and others)

we don't make a diverance based on the kind of rig as you kan see it by
looking at the frame/statustext:
thd-7 > as first token of the status text
tm-d700] as first token of status text
mic-e other first token of status text
standalone tracker raw nmea string

i hope no-one wants to send a message wile driving 120 KM/H so it's only
usefull to send a message to a portable station

Exactly. Thats why they should only be used between cooperating units
that have unambiguously agreed to specific meanings.   If the sender is
unsure of the recepients interpretations he should NEVER use them...

Yes. But the problem stemmed from my misunderstanding of how the
Mic-Encoder format works. I thought that the text was sent over the air as
text not as a binary code that is then converted to text upon reception.

This format is unknown to me. It must be sometihg from WinAPRS or PARS+.

I need to see the raw packet...

Bob

I found this out too. Someone sent me an e-mail on it! Bob Bruninga says
that some older versions of the APRS software may not interpret the "custom"
messages appropriately.

What version were you running? Two of us have now had it happen.

During a recent Public Service Event, we found that it was very
valuable to send a message to a mobile and to *not* expect a response.
THus he can read the message and take action, without being expected to
reply. Shadow Operators that need to shadow non-ham VIP's
or mobiles listening to multiple nets may not hear voice directions; so
the only way to reach them sometimes is via TEXT message. Examples are:

    CALL Us on 146.76. NRR
or
    Go to Check Point 13. NRR
or
    QSY to LOGISTICS net. NRR
or
    When you can, go to MEDICAL tent. NRR

Notice I ended all of them with NRR meaning "NO REPLY REQUIRED"
Is there an already existing Qsignal for NRR, or is there a better
abbreviation? I think that with the THD7 and TMD700, it would be nice if
we (APRS) had such an abbreviation so that we do NOT always expect an
answer to a casual message to a mobile... Just a thought...

I don't mean just the custom code I mean sending NO Posit message. Just
send the GPS coordinate. Don't send "C1", "In Service", "Returning" etc.
unless you want to. Why is a "null" string not available?

With only 3 bits for the POSIT "comment field", then there are
only 8 possible comments. We chose "Off duty" for the NULL value...

I noticed the other day that a repeater frequency pair(standard offset) that
I programmed in wouldn't transmit. So I checked it, it had the right
offset, no PL etc. So I copied it to a vfo, then to another memory location,
same result! So I read the manual on clearing a memory location, I did as
instructed. Now the memory location isn't available! You can store a
repeater pair in it but it won't display. Now what do I do, a full reset?
I'm not ready for that, not until we have a piece of s/w in our pc to
program the D700 with.
  Another thing, when you want to manually send a position, you have to do
it twice, hold F for a second then pos, do both again, before the position
will
be transmitted.

You can fix that by making the APRS key-functions be primary so you dont

have to push the F key first. This is under RADIO-DISPLAY (I thhink! I
had to send my ALPHA test radio back, so I dont have one now to find
it)...

WIth the APRS FUNCTIONS primary, then they are all there all the time..

I have been seeing a four extra characters preceeding my status text:
     ]"6w}
when I look at my BCON on my TH-D7A.
The characters do not appear anywhere in the Status Text entry from
the APRS Setup Menu. Are they supposed to be there? If not, what do
I need to set to get rid of them?

82. [htaprs] Mic Extension Cables TM-D700a

From: "Kurt Johnson" <parrots@swbell.net>
Date: Tue, 4 Jan 2000 17:54:54
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-58283-2000.01.04-18.10.46--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been watching the discussion on the SIG about the Mic ext for the
D700 so, I decided to go look thru all the Kenwood Docs I have amassed
while installing various units for others... The Tm-732a/733a/V7a/G707a
as well as the Tm 742/642/942 all used the same " Connectorized microphone
cable" Kenwood P/N E30-3151-XX 4 meter and E30-3153-XX 7 meter So, I
guess that one could call Kenwood parts and get a price or look at your
local Hamfest for some on selling an extension kit for these radios.

PS I have the kit for my TM-V7A and I just finished trying the 4 meter
cable on my new D700 and I works, And none of the smoke came out (yet)

83. [htaprs] THD7 ALtitude!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 4 Jan 2000 19:26:14 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@tapr.org>
Message-ID: <LYR845-58290-2000.01.04-18.42.37--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For Pilots,

   The way we added altitude to the TMD700 format makes it possible
to manually enter an altitude into a THD7. Its cumbersome, but possible..
Enter your altitude as xxx} as the leading 4 chars in your STATUS text

Unfortunately XXX must be compressed using the base 91 character set
and -10000 subtracted from it and converted to Meters.. So the following
TABLE might be handy.   Just scribble the ones you need most frequently
onto a piece of tape on the back of the radio...

xxx}	ALTITUDE In FEET
"88	1000
"BB	4000
"EZ	5000
"II	6000
"LL	7000
"OO	8000
"VV	10,000
"ff	15,000
"vv	20,000
#00	25,000
#AA	30,000
#PP	35,000

These are approximate. I chose easy to enter characters instead of exact
conversions.   Remember, once you have one of these entered into your
STATUS menu, then it is EASY to modify it with the UP/DN Joystick.

PROBLEM: Current versions of all APRS software will probably not yet
decode these, since the SPEC was just published and the TMD700 just began
hitting the street, so I doubt any of us have put this ALTITUDE into our
code yet.. It will be in APRSdos in a day or so... Version 845 when
announced...

Those are the TMD700 ALtitude. It was not in my BETA radio, so I just

began to notice it too... In the production units, did Kenwood add a menu
to disable it?

New versions of APRS will decode these as altitude and display it...
Im sitting here waiting for someone with a D700 to drive through so I can
test it with my next version of APRSdos...

Is there a way to shut off these status messages on our (now)
old-fashioned d-7's? I'd just as soon leave 'em off, since they don't
usually apply to my situations.

In police code we used the phrase
'no reply needed'. We started out using
'no reply required' but 'needed' was simply
easier to say. Rolls off the tongue easier.
We later shortened it to nrn, pronounced
'en-are-en'.

Generally, in police radio we tried to stay
away from verbal confusion like dipthongs
(combined vowels) and tried to use phrases
that used more than one syllable and that
began and ended with hard consenants. For example -

Police units were not numbered 'one' or 'seven'.
They were named 'one-oh-one' (101) or 'one-oh-seven' (107).

Likewise 'en-are-en' (nrn) only requires your mouth/tongue to
change positions twice. You start and end with your
tongue on the roof of the mouth and just say 'are'
inbetween.

All of this has little or nothing to do, of course,
with text received on an aprs display. Phonics doesn't
enter into printed txt.

Just reminiscing.

BTW here's an interesting police dispatch nugget.
Early LAPD police radio was one way only. Dispatcher
broadcast on the am broadcast band! Cars couldn't
talk back. Dispatch just kept putting out the info
till a patrol car would arrive on scene and call the
station. Sort of a land line ack.

Up until the late 60's you could still hear the LAPD
on am broadcast. They were on VHF also but kept the
longwave link.

Earliest callsign for LAPD was the dispatcher's name
'ROSENQUIST'. Once the broadcast was 'ack'd' via
telephone, the dispatcher would say -
'8101 Figuerora, all is well...This is Rosenquist'
Later that was changed to the more familiar code-4.

Could someone please program in a repeater freq of 146.610- standard offset.
I can't get this to tx from memory, but it tx's fine from the VFO. When I
save the VFO to memory it won't tx. All other programmed freq pairs work
fine VHF and UHF. Let me know.

It may only be transmitted when a STATUS is transmitted. THus, they only
see "]". But when you have a STATUS, then the altitude is added? Can
you confirm? Also, can you set your STATUS RATE to something like 1/2 so
that only every other packet has a STATUS in it, and then tell me if the
altitude is only there when the STATUS is?

THanks

Bob,
Here is a sample of what I got off of the Terminal Window of MacAPRS.
I hope it helps.

<snippet begins>
N6IQA-9>SSTVUU,RELAY,WIDE:'.3Kl!L>/]"7'}

N6IQA-9>SSTVUV,RELAY,WIDE:'.3Ll!L>/]"6&}Steven in Los Angeles, CA

N6IQA-9>SSTVUW,RELAY,WIDE:'.3Ll!L>/]"5R}

N6IQA-9>SSTVUV,RELAY,WIDE:'.3Ll!L>/]"5'}Steven in Los Angeles, CA

N6IQA-9>SSTVUW,RELAY,WIDE:'.3Ll!L>/]"5k}
<snippet ends>

By the way the message appears, I wonder if this is actually a
problem with the way TH-D7A parses out the status text. Can it be
configured to work with this format or does it require a firmware
upgrade (if possible)?

Steven

Also this somehow caused my position to be wrong through some igate's.I
would really like to run with the Mic-encoding turned off. False emergency
alarms from scrambled packets etc, will water down the emergency function.
I don't think it's needed by me to ride around off duty 99.99 % of the time!
I don't see how it can be turned off though, but I think it need's to be,
for general amateur use....

73 Jeff kb2wqm

</quote>

There was one bit off in APRS+SA when decoding Mic-E Custom messages. I
have fixed it and will post a new version in the next few days. Sorry, I
was unable to test this function until I could get access to a TM-D700.   I
will not that the data decoded above from the IGate was not generated by
APRS+SA. Regenerated packets from APRS+SA show the message text in all
capitals. ENROUTE vs Enroute. So it appears that some other IGate software
is munging the Latitude.

/Brent

OK, Thanks. It appears that Altitude then is included in every packet if
a GPS is connected. Whether or not STATUS is included... I have a new
APRSdos that I will post today that will handle this...

The MCP-D7 software is out (version .01 beta) and has been for some time at
ftp://216.98.255.24/ So has the manual in PDF form. If you are talking about
the CD manual that is bundled with their $50 cable, I doubt if it will
become available for free. If it were available at any site, I am sure
Kenwood would be interested so that they could shut that site down.

If the CD manual is what you are interested in, you may be better off
ordering it from the states.

If memory serves me correctly I think we had to wait awhile for the
software to be released for the D7A? I think the software was put out
Feb. 1 (about 2 months after the radio).   So maybe it will take a
couple of months for the D700A software.

Hello All and Happy New Year,

I've read the printed docs that came with my TH-D7A, and the pdf docs on the Kenwood CD-ROM that came with my serial cable, and I hope someone here in internet land knows the answer.

The only way I have found to change the TNC baud rate in the D7 is to change the HBAUD setting with a terminal via the PC port. Is there any way to change the TNC data rate to 9k6 WITHOUT a terminal connected to the radio (like from the keypad)?

For Mac users (like me), with only USB ports, the Keyspan PDA adapter works great with the Kenwood PG-4 cable. I can use Appleworks terminal, as well as MacAPRS to communicate with the radio. I'm working on a program, for the Mac, similar to Kenwood's, to allow programming and controlling the radio. However, I am not a great (nor even very good) programmer, and it is taking considerable time. Maybe by Y3K :-)

I was wrong, the D700 TNC has a mini-mailbox. Set the Mailbox call using the MYM callsign command. THen activate it with "MBOD ON". I dont see much value in it for APRS, but it might be very handy for some applications, and emergency services...

I don't know what the problem was with the programming in of the 146.610 - repeater freq pairs. I called Kenwood, and they didn't have an answer. I did a full reset and the problem went away. The only thing I can think of is

some kind of cockpit error, on my part.
  I've been working with several of the APRS authors. The Custom position comments are giving varied results, for example a custom 1 in latest version of APRSPLUS shows up as an emergency. In WinAPRS it shows up as enroute, but the GPS lat field get's corrupted. So I'm staying away from the custom 0/5 until this is fixed.
 Going to try to post a short message on the PACSAT UO-22 tomorrow. I already hit another PACSAT for directory requests. The 9600 baud full duplex is working fine with the WiSP s/w.. What a great radio!

The APRS+SA problem has been resolved. I will be posting an updated version soon. Just a simple bit inversion. It is always easier to test a system if you have the full system!

All, You all probably have tried this, but if you go the D7A site, I'll list below, and look at the PC comtrol commands for the D7A and try them on the D700, they work.

For example, if you issue a AI 1 to turn on reporting and then set the radio to memory mode and rotate the knob, you get the information coming back about all the memories.

I did the at 96,n,8,1 and with no TNC turned on

Ok, who wants to try the D7A software on the D700?

Message-ID: <LYR845-58514-2000.01.05-21.53.48--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In Omaha, Nebraska, the repeater trustees have given their blessing to turn the wide area 146.34/94 rptr into a MicE capable machine. It is a work in progress now. However...

We know that the THD7 can only do APRS data on one band only, so if you want to use the PTT MicE capability with your local repeater, you might have to give up *receive* APRS capability on the THD7 while working your repeater pair on Band
A. The following scenario, however, might be another way to look at it. This assumes a typical VHF 146.94 repeater, adjust offsets accordingly if another using VHF freq.

Here's an idea to do MicE on the THD7 (and possibly D700 mobile) with 146.94 and still receive *inbound* aprs on 144.39:

1. Set Data band as Band A
2. Set a memory to 146.94- regular repeater split,
   and bring it up in Band B
3. Set a memory in Band A to 144.39/146.34 split:
   a. Set receive of 144.39, store it in a memory channel
   b. Go to that memory, press "F" function key
   c. Change offset (this channel only) to 1.95 MHz
   d. Use "F" "Shift" to select PLUS + offset for this memory
   e. Name the memory channel to remind yourself of nonstandard set
   f. SAVE the frequency back into the memory channel to save the settings
4. Activate DATA TX - > PTT in APRS menu
5. Set desired beacon rate
6. Turn on TNC to APRS mode
7. Press BCON to turn on MicE Beacon capability
8. Adjust Band BAL accordingly to shift volume to Band B for repeater output only.
9. Set DCD Sense to both bands in Radio->TNC in menu

Don't forget to monitor the repeater on Band B to make sure it's clear before transmitting.

Now when you transmit on Band A, you will be transmitting on the 146.34 input of .94. At the end of your transmission, if the beacon "wait" time has expired on the D7 (enabling the MicE burst), your MicE burst will go out over 146.34, and hence, over the repeater. The .94 repeater will be set up to mute the output when your packet burst occurs.

When you unkey, you'll still have the 146.94/34 repeater pair programmed in the Band B, allowing you to hear repeater audio of other users, and your Band A will be using the TNC with APRS. That way you can cover four needs:

1. Transmit MicE bursts and voice over the repeater input
2. Still monitor the repeater output for replies
3. Still monitor APRS data channel for activity
4. Still be able to use Band B for the regular repeater audio, sans MicE, but still monitoring APRS on Band A.

Of course, I haven't been able to fully test this theory with the repeater until the MicE hardware is set up. But, the radio seems to perform as needed to
accomplish this! Only drawback I see right now is the need to keep the Band B (146.94 receive) audio *down* while transmitting to avoid feedback through the speaker and repeater. I'm anxious to test this theory.

Let me know if this is a good idea. Any comments? jimgill@ix.netcom.com
Thanks,
Jim - N0RMO

It's obvious, I know, but the repeater site of course would be set up with a
TNC and an additional radio on 144.39... the MicE burst would be ported over
to the APRS frequency using the proper method of repeater muting and channel
holdoff on 144.39 as discussed on the sigs.

Jim -

I see a small problem with this arrangement, though I'm not a seasoned
user of APRS, so I'm not sure I appreciate the value of this setup in
the first place.

While your TH-D7 is burping a beacon on the 146.34 repeater input
another APRS station may be burping on the 144.39 APRS simplex
frequency, which your radio will never hear since it's transmitting. I
realize this is a small thing, no worse than a beacon collision, I
guess.

Secondly, (and I think more "weighty") while your TH-D7 is burping into
the repeater input, and the repeater dutifully mutes the output for the
benefit of voice users, the repeater is actually busy, though nobody
monitoring the 146.94 output can tell. This may lead to a double of a
repeater voice user transmitting over the TH-D7, simultaneously wiping
out your beacon and causing confusion to the voice user.

Just one man's opinion.

The TNC at the repeater site (preferably a KPC3+) would handle the collision detection... you would have the MUTE running to the repeater (discussed below) but also a holdoff from the 144.39 radio to the TNC. If a signal comes in from a MicE on the voice repeater, and there is another signal is on 144.39 simultaneously, the TNC will buffer the packet to be transmitted *after* the current packet on 144.39. The holdoff from this radio performs the same function that every other TNC on the freq would be doing... CSMA or Carrier Sense Multiple Access (I hope I got the acronym right). The repeater input doesn't need to know that there is something else on 144.39 at the moment; the TNC will transmit when the frequency is available.

> Secondly, (and I think more "weighty") while your TH-D7 is burping into
> the repeater input, and the repeater dutifully mutes the output for the
> benefit of voice users, the repeater is actually busy, though nobody
> monitoring the 146.94 output can tell.

The nature and goal of the MicE burst is for it to be as short as possible. Typically a true Mic-E would transmit the entire compressed packet is about .3 of a second... short enough to be sandwiched between the end of your voice transmission and the repeater courtesy beep. A THD7/TMD700 MicE burst will typically be slightly longer than this, especially if one uses a long path and a long status string. It would be advantageous to use short paths or Widen-n capbility, and the shortest status necessary to keep this length down.

In testing, I entered a path of RELAY,WIDE,WIDE and a status text filling the maximum available space in the D7. When monitored by ear on another radio, the packet was still only a little over .5 of a second long. Also, the MicE burst will usually not be on *every* transmission, since you have to set a beacon time in the D7. For example, setting the beacon time at 2 minutes means that the MicE burst is only able to at a minimum be sent that often, no matter how many seperate voice transmissions you make. So with proper setup and use, I think the impact on voice users at the repeater would be at a minimum.

IMHO.

Jim -

OK, I'll buy that. Like I said, I'm an APRS neophyte, and I appreciate

your explanation. As you point out, a 1/2 second burp could easily fit
in the pause before a courtesy tone, so the repeater won't appear to be
idle as I feared anyway.

BTW, the time stamp on your reply (18:20) appears to be about 5 and 1/2
hours earlier than my post (23:56). Even accounting for the EST/CST
differential, how could that be??? :-)

> NNTR ? hi

Actually, it might be pronoounced 'nenter'. We abbreviate a lot
of stuff in cop talk (and other lingo). Stuff like -
BOLO pronounced bowlow for Be On the Look Out
VIN pronounced vin for Vehicle Identification Number

Even our own APRS, pronounced 'apers' not A-P-R-S.
Or SIG, VOM, WYSIWYG, SCSI

LAPD has a unit called CRASH -
   Community Resources Against Street Hoodlums

One of the strangest, and this is true:

A PD somewhere in the east has a special team called
Fast Action Response Team. They are called...FART

How'd you like to be Captain Joe Blow, FART Commander.
Quite a business card / resume entry.

Great idea, Jim. I don't think you'll have a feedback problem, since the
radio isn't full duplex on the same band -- when you're transmitting on Band
A 2M, the receiver in Band B 2M will be dead.

GOod idea. I think it will work.

But then I guess the question is "why"? As you know, I thought the Mic-E
was going to be the hottest thing in HAM radio, since it added APRS to
any voice radio without the need for 2 radios.... THe concept is
fantastic.

Problem is, by Kenwood doing it in the THD7 dual band radio, you get two
radios-in-one, so the advantage of "saving-a-radio" is lost. Therfore,
just operate voice on one band, and APRS on the other and no need for
the voice repeater to be Mic-E capable. ARGH!!!

This is the MAIN REASON THAT MIC-E VOICE REPEATERS have not caught on.
Because the THD7's and TMD700's dont need them. But still the
$79 cost of a Mic-Lite compared to a $450 HT, is still an advnaantage of
the Mic-E that will eventually grow some more Mic-E repeaters...

At least that is the way it appears to me... :-)

But the Mic-E burst is only 0.3 seconds, (Less than most courtesy beeps)
this wont be a problem. ALso, since the input is still busy, it just
holds off the beginning of the courtesy beep anyway.. I think?

On Thu, 6 Jan 2000, jsr wrote:

> What the heck is a Mic-Lite? Is that like a Bud Lite, Same great features
> without all the weight?

Yep, the Mic-Lite is a complete AX.25 TNC transmitter on a 1 by
1.7 inch micro miniature board that is capable of sending 5 analog
channels of telemetry and 8 data bits. It also sends a BText and GPS data
if a GPS is attached to the serial port. It is so small, you can build it
into most microphones!

The Mic-Lite can operate in either the MIM Telemetry mode, or as a
Microphone Encoder (Mic-E) to include GPS and telemetry data on the
tail-end of a voice transmission.

Included with the package is a file Mic-Lite.txt that shows you how
to make a Mic-E with only 2 external diodes. Or you can add as many front
panel switches to add more Mic-E functions such as PATH selection, MESSAGE
selection, or variable PERIOD rate. The Mic-E is a way of adding this
data to the tail-end of a voice transmission as soon as the PTT drops.

It is $79 ea or $69 in 10 or more +$4 S&H...

For details, see http://www.toad.net/~wclement/mim2.htm
To see some Mic-Lites: http://web.usna.navy.mil/~bruninga/mim2.html

Or download all the docs from tapr.org/aprssig/dosstuff/APRSdos and get
the MIM.ZIP file...

Hi Ed

Although the 'doubling' is technically possible two things need to be considered. First the data is compressed and thus a very short packet, I think it gets transmitted in several hundred milliseconds. (Unlike many of the uncompressed packets your normally hear which can take up to a second or more) The second is that the TH-D7 is still in the transmit mode after the voice traffic is finished and thus the courtesy beep would not have sounded and the other party should not be transmitting untill they hear the beep. This is true even though the data audio is muted, the COR on the repeater is still detecting the carrier.

However in reality lots of folks don't wait for the beep but they do wait to be sure the other guy has really finished talking before we hit the mike button. That wait alone is enough for the data to get passed and then you have to add the time for the other radio to come up to frequency and start transmitting etc.

Thus I don't think this is a problem to concern ourself's with. Now if we tried this on HF in a DX pileup with all of the tailgating of callsigns........

C u all

I was reading the manual for my D700 last night just as I went to bed. And this morning I think it said you can set the radio up so that the D700 can be a differential receiver to your GPS? I take it this means you have to have a local transmitter sending position data on a vhf or uhf frequency that the D700 can receive and then decode to send to the GPS to improve the accuracy.

Is this right? If so what a deal!

Out in the west we have huge area mt. top to mt. top
(CA,AZ,NV,UT,ID,WY. can all talk to each other.
It would take much equipment to have a good APRS system working.
This would be a good place for Mic-e, if it was used for those using the
repeaters. It would not be a good idea to hook up 144.39 to it.
It would be for the aprs network to receive the positions and put them
on I gate. Dumping aprs bleeps on a Western state network input would
cause another repeater war.(for those that can remember back that far)

Well, I thought of another reason why the Mic-E could catch on.

When I had my TH-D7A in the car, I had a single band 440 radio for UHF and
my TH-D7A handled APRS as well as my 2m repeater needs. Now though with the
TM-D700A mobile, I removed the 440 single bander and the HT. Oops! I just
lost one radio band. I can now monitor only one repeater if I am on APRS at
the same time. No more listening to chatter on 2 repeaters. This is the
BIGGEST disadvantage of using the TM-D700A.

BUT.......With the Mic-E capabilities of the TM-D700, now if I had a local
2m machine with Mic-E enabled, I could still blurt my packets onto the local
network while I talk and yet I still have the second band of the radio tuned
into another repeater.

So, more Mic-E repeaters would not be a bad thing at all.......

Subject: [TMD700A] Various questions

>Greetings.
>
>I currently own a TH-D7 and have pretty much got a TM-D700 on order for
when
>they are released here in the UK, but I have a handful of questions that I
>hope can be answered by the list.
>
>1) What are the beacon interval settings? Are they more varied than the
>D7?

They beacon rates are quite adjustable. I run from 3 to 20 minutes. WIthout
looking at the manual, I do not remember the limits.

>2) Does the radio act as a digipeater? If so, can the digi alias be set,
>and does it support alias substitution?

It does act as a digipeater. Alias can be set to RELAY,WIDE. I don't recall
about substitution, but I think it does if I recall my display properly. If
you set UIDIGI on and set the calls to nothing, then it will only digipeat
directed packets. I have my D7 digipeated by NY4I-15 and this works quite
well.

>3) Do the PM modes (assuming it has them) configure the APRS modes, ie PM1
>can be set for voice, PM2 is with all the APRS stuff enabled etc?

Yes. This is one of the best features. I use on PM to set my 3 minute beacon
rate and select a memory on the voice side. I change many settings on that
one. I use PM 4 for when I am parked. I set the beacon rate to 20 minutes,
set position ambuigity to 2 digits, set an auto-reply message, and many
other APRS settings. I also turn off the display light and turn off the
other band.

>4) What's the connector to interface to a GPS? The D7 is a 2½mm jack, is
>the D700 the same?

Identical connector and wiring.

>5) If an APRS packet is due to be sent on VHF, but one is transmitting on
>UHF, what happens? Does the D700 wait until the carrier is dropped on UHF,

>or can it transmit simultaneously?

VHF yes, depending upon the DCD sense setting. YOu can have it wait or mute
the other side. On UHF, I have not observed what it does.

>6) Are the "beep" modes more variable than the D7?

There is now a beep setting called MINE. This sets it so it will only beep
if it sees your packets or a packet destined for you. This includes your own
digipeated packets and messages as well as incoming messages. The other beep
modes are there as well, but who would use them. By the way, this feature is
now on the D7 in firmware, but I do not know if it is shipping yet. I saw a
D7 with "Beep Mine" at the DCC in Phoenix.

The beep volume of the radio and the voice level are adjustable independely
of the speaker volume. I always keep the data side volume down, but I still
hear all the beeps.

Jim -

Yes, I have conceded that the Mic-E burst would be too short to be of
any concern. Like I had mentioned, I'm an APRS neophyte, so I'm still
getting up to speed on all the variations. Thanks for the explanation,
though.

One thing I just read in a post today from Bob Bruninga regarding the
Mic-Lite is the term "telemetry" which has been noticably lacking in
most conversations about APRS. In contrast to conventional packet radio,
which is a point-to-point data mover, APRS is primarily a telemetry
application.

I am still baffled why APRS has become the predominant digital
application of amateur radio, while packet networking has just never
caught on. In emergency comms applications, I see TCP/IP packet for
e-mail and data transport being far more valuable than telemetry, yet
very little resources seem to be allocated to the development of these
technologies. Just my observation, of course.

There are lotsa reasons why it has caught on:

1.) Ability to "SEE" other stations
2.) Ability to track others or even oneself.
3.) Ability to easily send messages keyboard to keyboard with another ham
4.) Weather station capability
5.) National Weather Service storm alerts: Turns affected counties different
colors depending on if there is a watch or a warning
6.) The UI frame is much more efficient than sitting in a network where you
have to have proper error correction and acknowledgement
7.) Ability for easy mobile operations. Particularly valuable in emergency
or special op situations. It is easy for people to see where shelters are,
where emergency crews are, etc.
8.) Feeling that what you are seeing is "live" and not just on some bulletin
board somewhere
9.) The short packet bursts and the small amount of information transmitted
works fine at 1200 bps. BBS and e-mail work is just too slow nowadays for
1200 bps.
10.) It's just COOL technology. Who wants to use a BBS program that is
still command line based and was written 10 or 15 years ago?

While a high speed packet backbone may be quite useful for passing e-mail
and so forth in an emergency situation, my bet is that most of the time, it
would remain idle. On APRS there is always something to see, someone to try
to talk to, etc. And it works great for sending health and welfare messages
as well.

So when you add it all up, APRS is a great tool and people see it that way.
I consider most normal packet boring. The way the frequencies and what not
are divided up in a given area are confusing; where do you find the latest
list of what's where; etc....APRS is simple: 144.39 MHz or 10.151 MHz LSB
(not counting the 10m, 17m, and other freqs people use).

Lastly, there is one other vastly used part of packet radio: DX Clusters
APRS can be used to monitor DX clusters as well!

While APRS may be a lot of telemetry it is FAR, FAR more than that.

Are you saying you can 'talk' between all those states?
Are you referring to voice or aprs? Surely you're not
talking about 2m VHF are you?

Regarding RESOURCE.TXT in Bob's APRSdos documentation:

Bob suggests using the DX spot format on 144.39 that could send specially
formatted messages to the DX List in D7's or D700's. I'm using one of the
LT buffers in my KPC3+ to send a packet on 144.39 about a local repeater
frequency. Hey, this might even be the method Bob was seeking out during
his last trip to be easily notified of the local repeaters in each area (at
least for Kenwood users)!

Anyway, quoting the doc file on this one, here's the format:
(set your email prog to fixed width characters for clarity):

======
To send a packet to be displayed on the THD7, use this format (broken up
here into two lines to fit Email:

 URCALL>RESORC:DX de YOURCALL.>
 1111111112222222222***3333333334444444444**********55555

 Fields 1,2,3 and 4 are all 10 bytes and field 5 is only 5 bytes.
 ALso: * TOCALL must not be any valid APRS TOCALL (thus I used RESORC)
        * DX de is required
        * YOURCALL. is a 9 character field which must be padded to 9
======

Note: The * characters in the example indicate SPACES in your string. 3
spaces between 2 and 3, 11 spaces between 4 and 5.   Pad spaces into any
unused characters in each area where the numbers are.

For example, you could use this as a traveler's local repeater frequency
reminder service. Use this on a WIDE that has LT's available, or on a local
station one hop to a WIDE, within the repeater area. Use no path on the

WIDE, or maybe one hop only from the local station to confine the repeater
reminder to the local area only for Hams driving through. Example:

BLT 1 E 00:15:00
LTP 1 REPETR
or
LTP 1 REPETR V WIDE
LT 1 DX de N0RMO****>
146.94-***W0EQU/R******Mic-E RptrOmaha, NE************OPEN*
(the previous line should not be wrapped... it is still on the same line
after the >)

Remember the * are required spaces, in addition to the spaces present within
the 10 character fields themselves. Since the DX List is designed to hold
call, frequency, and 2 line comment, plus a 5 character time field (which
could be used for PL), this is an great idea from Bob that could be useful
for travelers. Yes, it's biased toward Kenwoods, but "dumb" standalone
trackers can't read the mail anyway, and computer equipped trackers could
always catch it in the History List (which I always monitor anyways when
mobiling WinAPRS). I suppose you could instead use a BLN style message
properly formatted within an LT buffer, but it's the idea that counts.

Thanks for your time as usual,

Jim

For the THD7 it was: Give KISS command. THen send RESET. Whenever power
was lost, it always came up fresh in normal mode... I dont have my 700
right now...

I think the best deal for most people today is the Palm IIIe.

The 5 is neat due to size and weight but its more than your price range.

Bob,

   Regarding your post that repeaters aren't being Mic-E-fied because of the
Kenwood radios - that's true, to some extent, but there's another factor -
the big reason that Omaha is looking at installing it on our 146.94 repeater
is because it's an extremely wide-coverage machine, covering a 50-mile
radius quite nicely. There are no digis around that come close to that, and
there probably shouldn't be.

    So, even with the TH-D7 and the TM-D700 around, there's still a need for
this, because it will make it MUCH easier for me to get my TH-D7 packets out
into the APRS network during storm spotting and other service events.

Another problem with the Mic-E concept is that it only works when YOU are
talking on the repeater. If someone else is talking and ragchewing on the
repeater, there's no way to send your posit. Also, if you ID, "KE9NA
Listening", and BRRRAP! And then no one comes back to me, then in order to
send another posit, I need to ID again or kerchunk the repeater in another 2
minutes or whatever my beacon timing is. So if I am not talking to anyone,
it might be a LONG time in between my transmissions of posits. Obviously,
that's not too good.

Hmm.. About a month ago Value America had the Vx for about $180 shipped.
So keep looking...

Unless you find an "awesome deal" I would go with the Handspring VISOR.
http://www.handspring.com/

It runs the Palm OS, Infact its made by 3 people who started the palmpilot.

That's exactly the same reason we are trying to get the repeater operators
to accept mic-e on there repeater site's but right now most don't want
anything digital on the repeater.

to overcome this we plan to put a mic-e gate at a home near to the repeater
site so it becomes interesting to use mic-e/kenwood on the repeater.

when the operater discovers that the frame's are short (0.3 - 0.5 s) he
might put the gate on the repeatersite

ahwell we will have to wait and see what is going to happen

(the repeater we are talking about is the aprs backtalk repeater in a big
part of the country)

www.pocketaprs.com

The Palm IIIx is in the $220 range at the moment. It sports the new display,
has 4 megs built in, and has an expansion slot internally(more memory(more
maps!)), and will support future operating systems. I'd say that's the buy
right now for a Palm APRS person.

http://www.palm.com/products/family.html

This is a matrix for comparison of the "3Com" Palms

> Obviously, that's not too good.

TWO thoughts:

1) Thats why I put 144.39 in my radio's "CALL" memory. WHen I want to
send a posit, I just hit the CALL button, kerchunk the MIC and then hit
the CALL button again... to get back where I was...

2) If it is truely a Mic-E repeater, then just enable the AUTO circuit in
your Mic-E or Mic-Lite.
If the repeater output is not busy, it will then key up your rig
automatically and send the packet. THis will NOT be heard by otehr voice
users because the Mic-E repeater should have a kerchunk filter on it
anyway that wont bring up the voice OUTPUT for a Mic-E kerchunk...

Really? It was my understanding that you can set a TH-D7, as well as a
Mic-E, to send out posits alone if you don't talk for a certain amount of
time. I don't have much experience with it yet, but that was my
understanding.

I suppose that since a Mic-E unit has nothing to go on but the microphone,
that's not the case there, but I think a D7 can do that..

Not the Vx. That model just came out and it is a $400+ unit. It must have
been a different model or Value America was taking a loss on it!

The Vx is the top of the line model (excluding the VII).

Tim,
No, when the THD7 is in PTT mode (mic-e mode) the unit will only transmit a
posit when PTT is released, and only when the TX interval has passed and
BCON flashes to indicate that. The AUTO mode will send posits AT the
interval specified, but not upon key release in mic-e fashion. So in AUTO
mode the posits would likely be out of sync with your conversation or step
on a repeater user, depending on your combination of frequency DCD sense
settings.

I believe the true mic-e's will do what you describe, though.

I thought the 'e' model only had 1/2 the memory of the others and thus
was marginal, if usable at all, for APRS maps.

Per the original message, perhaps someone knows where the web site is on
PALM APRS as it would be a shame to have spent all of your bucks on a
good deal only to find it won't work for the APRS application.

Hi Ed

I replied and it seemed almost 10 other folks did also. Hope you didn't
feel we were ganging up on you!!   I find this sig pretty good for folks
who, like you seem to be, interested in learning what is going on and
WHY.   Not enough time in my life for the flame throwers and I hope you
didn't get that feeling from all the comments you received.

telemetry
> application.

Yes that is true.   Most Weather Stations output data which can be put
into the serial input port just like GPS data and so WX is easy to do.
The rest of the telemetry is a different story however as there is no
guarantee of what it means.   I am logged onto the internet now and just
looked at the telemetry tab on APRS+ and there are about 8 stations that
have sent data.   The KPC3+ has several A/D converters built into it and
can easily send the digitized data but who knows what sensor is applied
to the input and what the calibration is.   But the application for
monitoring a repeater site battery voltage, power status and door alarms
are really neat features.

>
> I am still baffled why APRS has become the predominant digital
> application of amateur radio, while packet networking has just never
> caught on.

Actually packet networking did catch on and with a pretty good head of
steam but all of that was before the internet became widely available.
However in the transition, a few folks ruined packet as they got busy
sending jokes and recipies all all kinds of drivel and at about a 300

baud throughput rate, most folks got tired of trying to connect to their local bbs and trying to find what new info was there. Pretty soon folks decided this was useless and just quit and the critical mass to keep the interest up was lost. Note that the DX-Packet Cluster is still alive in a lot of areas as are some very specialized BBS's - T-Hunting and Swap Nets etc.

> In emergency comms applications, I see TCP/IP packet for
> e-mail and data transport being far more valuable than telemetry,
> yet very little resources seem to be allocated to the development of
> these technologies. Just my observation, of course.

I again think it is the case of no critical mass. I presume you are aware that APRS does have messaging as well as bulletin capabilities and that you can send messages to selected groups for such purposes. Our local RACES guys try that from time to time in communicating with the Red Cross station. They had visualized it would be great for lists of who was admitted to hospitals etc. However for tactical comm is just is not fast enough and so it never caught on in other applications.

Good luck and feel free to ask any questions. I presume by now you have found some of the major APRS sites where they discuss how to connect up the hardware to make trackers etc.

I will be conducting a forum on APRS at the Jackson, Mississippi Hamfest and Mississippi ARRL Convention on February 5. I would welcome suggestions on a presentation as well as an agenda for stimulating interest.

We put an APRS digipeater (AB5WF) on the air September 3, 1999 here in Jackson. Our friends in Vicksburg followed with the K5ZRO digi a couple of weeks later. There are a few of us active in central Mississippi, but this mode is still not well known. I gave a presentation at the Jackson ARC meeting in November to bring our club up to speed. (The Power Point presentation is on our website: www.jxnarc.org).

There are a couple of die-hard packet users who are probably hostile to APRS. I'd like to be prepared to argue FOR APRS, not against traditional packet. Jon Ogden: Thanks for your recent top 10 reasons why APRS is COOL. I'll use that.

Any suggestions will be welcomed. We are working hard to plug this hole in the map!

<color><param>0100,0100,0100</param>This message was sent to the group yesterday. I haven't seen a public
response. I'm very curious to read an answer to this question. Does
the D700 really serve as a DGPS receiver?

I'm very intereseted in this radio and plan to purchase one soon.
However, "version one-point-oh" blues has gotten me more than once.
I'm waiting on this purchase until all unfound issues have been found
out. In the meantime, it sure would be usefull if Kenwood would publish
a .pdf version of the doc.

 I was reading the manual for my D700 last night just as I went to bed.

 And

this morning I think it said you can set the radio up so that the D700 can

be a differential receiver to your GPS? I take it this means you have to

have a local transmitter sending position data on a vhf or uhf frequency

that the D700 can receive and then decode to send to the GPS to
improve

the accuracy.

 Is this right? If so what a deal!

Dwight

> that's not the case there, but I think a D7 can do that..

Otherway around I think. THe Kenwoods did not implement the Mic-E "AUTO"
mode as designed into the Mic-E and Mic-Lite. But they do have a "AUTO"
mode... Here is the difference:

THD7/TMD700: Auto mode here is just like any dumb tracker. It will
transmit every N seconds or minutes. Just like any TNC, it will wait a
fraction of a second for the channel to be clear. BUT (I think) this
Carrier Detect is packet detect, and not just carrier detect. THus, if
the channel is busy with VOICE, it may still transmit. ALso, it does not
do this AUTO separate and independent of the PTT mode. THus in AUTO mode,
it will never transmit on release of PTT.

Mic-E/Mic-Lite: AUTO works in conjunction with PTT mode. THere are 3
timers. One for PTT enabling and one for AUTO (usually longer). PTT
posits work as normal. But if an additional period of time (AUTO time)
occurrs and you have not transmitted PTT, then it will check channel clear
and wait an additional 3rd timer (maybe 5 seconds) and then if the channel
is still clear of any audio, it will Kerchunk the PTT and send a packet.
This packet has an additional TXD to take into account the additional
transmit key up delay. Thus when you configure AUTO mode in a MIC-e
(front panel switch turns it on/off) then you configure 3 timer values:
PTT delay, AUTO delay, and channel clear delay. The THD7/D700 does not
have any of this additional logic...

The Channel busy detect in the Mic-E is purelly an envelope detector. It
will hold off on any noise (but it does need lots of audio to drive it).

> well known.

You didnt mentiion if you can see other activity outside of Mississippi.
It might be useful to:

1) Somehow get someone out 50-60 miles to put up a tempo digi to bring in
some more outside traffic..

2) Put up an IGate and set it to FEED internet acitvity into your area...
I think APRS+ and some other LINUX routines have been written to serve
this kind fo temporary need to flood a local channel....

Rendered body type: text/plain

> > I am still baffled why APRS has become the predominant digital
> > application of amateur radio, while packet networking has just never

My view is that packet itself became boring - initially there was a good
deal of live messing about - node hopping and beaconing your station
details encoraging live connects - then folk started to 'tell you off'
of you enabled a beacon - then traffic levels (unviewable 7PLUS binary
files of all sorts of daft pictures) became such that
node hopping stopped working -- and packet became an off-line mode,
which the internet does thousands of times more efficiently.

The packet clusters might have saved things, but the majority of
2m operators dont have HF, so that wasnt enough IMO. At the same time
folk tend to have one 2m base station - so packet killed 2m ssb and
even 2m FM is deathly quiet compared to how it was ten years ago. We
recently doubled our channels with 12.k spacing - Im not aware that
any have been needed yet!

APRS is live, different, on a separate frequency from people who
'police' the bands (well for now anyway....) and encourages
mobile activity (so suits people who have never managed a
rock breaking station, or who can't afford one...). It seems to
have interested a number of people that had stopped using their
TNCs.

My major concern about it is that it is developing in so
many directions it is likely to run out of bandwidth on a single
frequency - and that will bring the 'oi, turn that light out!'
brigade back... ;) (little world war two reference there...)

Fascinating mode however. Especially now that we have several
mobile folk running up and down the country (uk). I look forward to
a network of weather nodes too (any suggestions as to how
the weather icon might show rate of change and direction of
pressure- because that would be interesting on a 'whole country

map' basis.)

Yes, it is my understanding that if you split data TX/RX on vhf/uhf, you can
transmit your position on VHF and recieve DGPS on UHF.

After doing a little looking around on the web it seems the frequency for
DGPS that the USCG uses is Frequency Range: 283.5~ 325.0 kHz So the D700
might have a hard time with that. Still the question is will the D700 work
as a dgps receiver if it can receive the correct frequency and decode the
data?
I know that commercial services offer dgps using sub-carriers on commercial
FM transmitters.

There seems to be a misunderstanding about how GPS decoding is done. GPS
decoding is done entirely in the GPS unit. It receives the satelites, decodes
the data, converts it to lat/long shows the results on the readout, and ouputs
it in a standardized serial form that the radio can read. The radio only
decodes this final data stream.

What is broadcast in the low band is not DGPS but the DGPS correction signal.
It contains the selective availablilty corrections to be applied to the satelite
data so as to get the correct position. You can receive the DGPS signals on any
low-band receiver but all you hear is a digital buzzing which is usless without
the proper decoding which is part of the circuitry inside a DGPS receiver. The
DGPS receiver decodes this and the output is fed directly into the GPS (which
must be DGPS ready) and the GPS then applies the corrections internally, giving
you the correct position. You must have both, a DGPS receiver and a GPS.

The commercial DGPS systems are more accurate and the special equpment and
licence fees are quite expensive. You could try to hack it but it would be
illegal to do so, more or less equivilent to hacking pay TV.

There is a DGPS decoder board available from TAPR but I think it is only for one
specific unit. (Check it out on the TAPR site).

Phil

> ... look at the PC control commands for the D7A and try them on
> the D700, they work.

I just got my TMD700A mobile, and I was excited and surprised to find this capability. I have a D7, but since I've never made or purchased a serial cable for it, I never got the chance to see or try the D7 control commands. Now since the D700 has a standard DB9 connector, I tried AI 1 and am able to check out all the data flowing out the port when the radio is action. It is quite amazing how much detailed information the radio spits out the port, especially even with the TNC in APRS mode. I'd be happy to send anyone that wants it an example text capture file of the data coming out of the port with a brief description of what the radio is doing at the time.

Quite a lot to learn with this, but I can visualize some pretty exciting ideas for a control program for the D700!!! A totally visual screen, with all kinds of control and memory options, plus full display and logging of all APRS data as it comes out the serial port. I just don't have the programming skill that the great authors on the sig do.

On a related note, regarding the quoting below on wanting an alternative outboard method of message entry for the D700 when in APRS mode; while the D700 allows control and monitoring of most every option through the serial port, it does *not* echo message entry functions out the port when you use either the control head or keyboard to enter a message. I'm still researching it to find a way. It appears with everything else you can send to the radio to control it over the serial port, there has to be a way for msgs also.

Thanks, Jim N0RMO   Omaha NE

For information about home brew DGPS receivers try :

Rich Heineck's Homebrew DGPS Receiver Page
http://home1.gte.net/clseng/DGPS_index.htm

This guy doesn't appear to be a ham, but he does seem to have done
quite a lot of work in this area.

Has anyone on this list built something like what he describes ?

73 Paul / VR2YRC.

Rendered body type: text/plain

Since the 700 seems to be so similar to the D7, this leads me to believe that
the following functions will work...
On the TH-D7 messages can be input using the AMSG 00,CALLSIGN,Message text here
And read by input AMSG 01 (for read of message #1 AMSG 02 for read of message #2
etc)

FYI, AI 1 turns on output function (on the D7 and probably the 700) so you can
see what command different buttons send to the radio. This is very handy for
reverse engineering the commands for the radio's serial port. You can see the
serial command while you operate the radio from the radios keypad.

see http://www.radiohound.com/d7zpinfo.htm for more info

155. [htaprs] GPS Cable for TM-D700

From: "James Kalkowski" <toast@portone.com>
Date: Sat, 8 Jan 2000 17:21:50
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-59152-2000.01.08-17.37.58--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just got my new D700 yesterday and much to my dismay, the GPS cable was defective. It has a break in it somewhere. Has anyone else found this to be the case with their D700?

Not to be kept down, I went to RS and bought the 2.5 mm telephone cable that has been discussed here in the past. If you are thinking about buying this cable, let me give you one word of advice...Don't! It is like trying to solder human hairs. I managed to get it working in my vehicle but I do not know how long it is going to last. It should hold until I can get a new cable.

With that said, I plan on buying a few cables from the mouser.com site. Given the cost to ship one, I am thinking about buying a dozen or so if there is a need out there for them. I can probably drop them into an envelope and ship them for about a dollar over their actual cost. I'd appreciate some feedback. Does anyone thik they'd be interested in these for about $4.50 - $5.00 each? If I get enough of a positive response, I'll do it.

157. [htaprs] TM-D700A 9600 bps operation

From: "Dr. Rick Olsen" <n6nr@email.msn.com>
Date: Sat, 8 Jan 2000 22:10:25 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-59247-2000.01.09-00.26.55--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The manual for the TM-D700 indicates that the radio will transmit with either GMSK or direct FM, but does not provide detail as to how, or even IF there is user control of these modulation types. Has anyone discovered whether there is more than one modulation scheme that can be used for 9600 bps operation? I won't rule out the possibility that the information is in the manual, and I just read past it.

Bottom line is that I am receiving the local node at 9600, but have not been successful thusfar in connecting to it. Pilot error, I suppose?

158. [htaprs] TM-D700A control commands web page

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Sun, 9 Jan 2000 03:06:37 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-59260-2000.01.09-03.32.03--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have started a web page to describe the control commands available for the TM-D700A. Using these, you can control and set many functions and options through the radio's serial port. This may help you until someone produces specific software for this radio. It has been suggested that maybe the TH-D7A software will work to program it, but since there are enough options and settings that are different enough and the record structure is likely somewhat different, I'm not in the mood to try it. In any event, go to

http://home.netcom.com/~jimgill/tmd700a.htm

and you'll be presented with the efforts I have made so far. Use these at your own risk and discretion... however, I monitored these right off the radio's serial port when I was programming the radio.

I guess I should thank Darryl VK2TDS for initially doing all the work on the TH-D7A commands, and giving me the idea to set this up. Hope my helps someone.

Hi Bob:

I refer to your recent post regarding Mississippi APRS activities:

>You didnt mentiion if you can see other activity outside of Mississippi.
>It might be useful to:
>
>1) Somehow get someone out 50-60 miles to put up a tempo digi to bring in
>some more outside traffic..

Yes, on good propogation days, we pick up the Baton Rouge, Memphis, and Alabama APRS digipeaters. This link allows us to bring in traffic as far as North Carolina and Georgia.

>2) Put up an IGate and set it to FEED internet acitvity into your area...

>I think APRS+ and some other LINUX routines have been written to serve
>this kind fo temporary need to flood a local channel....

Sounds like a good idea/project. One step at a time.

James,

  I too found the issue your talking about with the GPS cable. However, after further investigation, I discovered that the cable is actually just fine. It's just that the capacitance in your body, seems to be enough to prevent the ohm meter form sowing continuity if your touching it with your finger, like to hold the wire on. Try touching the connections, without your fingers involved, and it will show perfectly fine.

Very odd one indeed. But I wired up my cable yesterday to my GPS after finding this, and it works fine.

Walter/K5WH

Hi!
It's time again of my annual APRS web page links update. Please
take a look at my list of APRS web sites at:

http://www.n3hcp.com/links.html

Several links the were listed been deleted. Some may have only
changed URLs, so I need the help of all you good APRS users.
If you have, or know of an APRS web page, check for it on the list.
Let me know the URL of any pages not listed, and I will add them.

I would like to keep this one of the most complete list of APRS and
related sites. Your help will be greatly appreciated.

Thanks,

Gary N3HCP
gwells@nbn.net

Rendered body type: text/plain

Hi guys, a couple of questions that I need help on;

1) I have a Visor Deluxe (Palm Vx clone from handspring). To work on RS232 it needs a level convertor from TTL to RS232. Before I build one, has anyone successfully used Palm APRS with a Visor. The Visor uses Palm OS 3 but I'm not sure if the different serial port levels will cause a communication problem with the TH-D7.

2) I also have an older Palm Professional that runs Palm OS 2. Is there any APRS software that will run on this OS. In addition, are there any programs that will enable me to use the Palm Professional as an input terminal for messaging and test display when the TH-D7 runs APRS in Mic E mode (ie standalone)?

Thanks for the bandwidth. I am new to this reflector and APRS and find it aids greatly in APRS education.

Rendered body type: text/plain

I am pleased to report that a) I was not suffering from a senior moment after all, and b) my connect problem was multipath-related. Once cured, the D700A performed admirably on 9600 bps with the local tcp/ip machine here on 441.975. As for the GMSK vs. direct FM question, I'm still tracking down the answer to that one. Stay tuned.

Thanks to all who offered suggestions.

2000/01/09
Current Beta version is 1.99 XO found in APRS+2.zip.
1.99XO
1) Minor tweaks to Reply/Acks. Replay/Acks improve acknowledgment of APRS
messages. Note that Time Encoded message numbers has been disabled in this
release.
2) Fixed TM-D700 Custom messages causing Mic-E Alarm to be triggered.
3) Added Altitude to TM-D700 support.

167. [htaprs] mic-e repeater dcd

From: "Schayk A.H. van" <A.H.Schayk@arcadis.nl>
Date: Mon, 10 Jan 2000 11:05:03 +0100
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-59551-2000.01.10-04.22.16--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi

last night i had a talk with my local repeater opperator about the best dcd
for mic-e repeaters.

he stated that it had to be fast and only react to packet and not to voice
ofcourse this imposible as there will always be 1200 and 2200 tones in voice
so it will always be a tradeoff between quick responce and minimum
disruption of voice.

but there is a way to get around this:
his repeater has an audio delay to counter for the slow responce of the

ctcss decoder
this means that he has 110ms to discover if the dcd is activated bij packet
or voice and that seems to be plenty of time.
lets say you put the treshold at 75ms continues dcd you only have to cut the
audio 35ms after the treshold is passed (110ms - 75ms) this way you have a
dcd that is faster that the output off the repeater and utopia has been
reached :) because it is very unlikely that a 1200 or 2200 hz tone will be
longer 75ms in voice.

I have read the section on the RDF in the web page and the search in the
archives has not yielded much either. The APRS does RDF? Does this work
only on packet or can you use it to find the location of non packet stations
as well?

I thank all for the information in advance

That is exactly the design goal in the Kantronics KPC3 MUTE mode. It is
NOT A DCD. A DCD is designed to trigger on the first possible presence of
a packet. THe MUTE logic is independent and is designed to trigger only
after DATA has been present (error free) long enough to assure 99.99%
assurence and avoidance of a false detection. The MUTE circuit is not
detecting tones. It goes high after there have been N 100% successful
AX.25 valid BITS with no errors. (Or at least that is what I requested
KANTRONICS to do).

Yes, this works very well with a delayed repeater.

Even before the KPC-3, however, I felt you could do the muting with an RC
time constant and transistor to pre-filter the DCD as you suggest below..

Has anyone done this yet? I have a Tripmate that has been modified to be a
tracker. Does anyone have a pinout for the Tripmate DB9 to Kenwood GPS plug?

Has anyone interfaced any of the OEM type boards with the Kenwood that I
could mount in the trunk with the radio?

Dennis, N2LBT

173. [htaprs] Garmin III+ To D700A Connection lost

From: "Steven K. Ng" <skng@iex.net>
Date: Mon, 10 Jan 2000 16:46:46 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-59637-2000.01.10-19.04.33--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

During a cross country trip last week, I had a Garmin III+ and
TM-D700A configured to beacon positions every 10 mintues. This
worked for several hours. During the trip, the D700 stopped
beaconing becaused seemed as if it wasn't receiving NEMA sentences
from the Garmin III+. If I connect the GPS cable to a TM-D7A, I am
able to read valid positions on the D7A. If I replace the Garmin
III+ with an old Trimble Scoutmaster, I read valid positions on both
the D700 and the D7A.

The same cables were used in all of these combinations.

I also attempted a partial (VFO) reset of the D700A.

I went through all the gyrations of insuring that the D700 was set up
to receive NEMA sentences (not NEMA96), and that the D700 was in APRS
mode. Is there anything else I need to do to make this work?
Afterall, it was working for a little while.

I upgraded the Garmin III+ software to 2.03 this morning. No joy.
How do I completely reset the Garmin III+ start from scratch? I
wonder if that will help.

I disdain problems like this, because they defy obvious
explanination. I hope it is something simple I have forgotten.

Steven

I too have been thinking about the remote keyboard idea for the D700/D7.

On the D7 you can't enter the computer control mode if APRS or the TNC are
turned on. I don't know if this is true for the D700 (hope to get mine
next
month). I believe this means you can't enter a message without jumping out
of APRS mode, entering the message, and the jumping back to APRS mode and
waiting for the TNC to initialize.

I think we need to find another way. Maybe through the GPS???

> On the D7 you can't enter the computer control mode if APRS or the TNC are
> turned on. I don't know if this is true for the D700

You can use the computer control mode on the D700 in APRS mode or with the
TNC off. That way you can enter

AMSG 00,CALLSIGN,Message text here

while in APRS mode from the serial port. I have had problems using this
method if the MSG list is full in the radio, so clear *some* old messages to
make room for a new one if you try this method.

> I think we need to find another way. Maybe through the GPS???

Right now this is the most promising method. See
http://home.netcom.com/~jimgill for my D700 page - I will have more commands
listed "soon".

Rendered body type: text/plain

Mark...

An idea... would it be possible to add a simple TM-D700A client into WinAPRS? You would continue to use the D700 in APRS mode, and would use WinAPRS only to plot received stations on the map and simple message entry/reception, not in full TNC mode. I'd like to be able to continue to monitor stations and APRS data on the radio display head, but occasionally check the map on the laptop for stations while mobile.

When the radio is in APRS mode, it still can be controlled and monitored from the serial port. So could you possibly build in simple algorithms to decode the callsign/position fields in the Station List that the radio spits out when it receives a packet? This data would cause a station to be plotted on the WinAPRS map. This wouldn't be a replacement for running the radio in TNC mode, but would be another option to use to augment the radio features.

Also, possibly there could be a simple message entry and viewing dialog utilizing the

AMSG 00,CALLSIGN,message text here

format of speaking to the radio.

If you really wanted to get exciting, you could build in ultra-simple memory management and other ideas. Granted, it wouldn't be a full-blown control program, just something quick and easy to deal with entering and managing some of the settings that are tedious to do from the mic/display. Since WinAPRS already has the capability to communicate over the serial port, maybe a few added algorithms in the program might be easy to add??

I'll help with the research on data fields, etc.

Just dreaming. Bob - APRSdos? Mike - PocketAPRS (if room)?

Yes, recent versions of APRSdos already does this. Just plug APRSdos into the GPS port, and it will act like a GPS an plot the incoming POSITS (converted to waypoints by the THD7 or TMD700.

But supposidly, on the TMD700, with monitor on, the packets come out the PC port. On this radio, just plug in APRSdos to the serial port and it should operate normally while the radio is in APRS mode (you can only XMIT from the radio, not APRSdos in this case)...

OH, THIS WOULD BE PERFECT!!!!

Make sure it gets added to MacAPRS as well.

I hadn't thought of that, will try it with WinAPRS.

> But supposidly, on the TMD700, with monitor on, the packets come out the
> PC port.

Yes, in APRS mode the radio does send out data out the 9-pin serial port,
while it continues to send WPT information out to the GPS port. However,
the serial data is in Kenwood's and does not conform AFAIK to standard APRS
protocols.

> On this radio, just plug in APRSdos to the serial port and it
> should operate normally while the radio is in APRS mode (you can only

Unless you've modified APRSdos to read the Station List record format, I
don't see it working that way. I don't have VK2TDS's THD7 protocol page or
my page in front of me at the moment so you can see the format of the record

and the fields, but I can send you a capture of the data coming out the port
if you want.

I must admit, that option does excite me as well. One of the biggest things
I've noticed about the D700 is that you hop into the car, and immediately
you are APRSing. Although I love MacAPRS, there was a start up time which
made it difficult to use on a every trip basis. PocktAPRS cut down on this
time significantly. The D700 eliminated it. But I miss the friendly
interface of PocketAPRS, or MacAPRS for playing around or checking stations.

I really wish I paid closer attention in programming class in college.

<Corrections welcome. -d>
A USCG DGPS Beacon receiver is required in order to receive the 283.5~
325.0 kHz MSK corrections broadcast by the USCG. The TAPR DGPS Beacon
board interfaced to a Motorola Oncore VP GPS can be used to set up a
standalone DGPS Beacon at a previously surveyed site. (The Oncore has a
built in site survey.) Unfortunately the VP Oncore is no longer available.

As previously mentioned, the USCG LF DGPS Beacons use MSK at 50, 100, or
200 bps (is 50 still used?). The output of a TAPR Beacon could use higher
speed packet, or even APRS. The APRS protocol has provisions for this
through the generic APRS Callsigns "DGPS" and "RTCM", though I don't know
the details.

Presumably a receiver like the THD700 could pass the data from these
packets to the RTCM SC104 input of an attached GPS to get a corrected
position.

I am planning to set up such a beacon in southern NH.

If RTCM DGPS data from say the TAPR DGPSIB kit is being sent on
2m or 70cm your THD700 can receive it. The question is will the TNC in the
radio pass that data to the GPS.

The Garmin GPS units have a problem with the header data that comes before the RTCM
DGPS correction data. The Garmin units need the header data and RTCM to be on a different line. This is
not a problem with other GPS units that do a better parsing job.

You will obviously get a lot of (different) responses to this question. I
run a Palm IIIx because of the following

The Palm IIIx is in the $220 range at the moment. It sports the new display,
has 4 megs built in, and has an expansion slot internally(more memory(more
maps!)), and will support future operating systems. I'd say that's the buy
right now for a Palm APRS person.

http://www.palm.com/products/family.html

This is a matrix for comparison of the "3Com" Palms

There is also the PocketAPRS authors opinion on the matter at

http://www.pocketaprs.com

good luck,

I just did this Tuesday. Data pin 2 of the Tripmate to the ring (red wire)
of the Kenwood connector. Ground pin 5 Tripmate to the sleeve (shield). Tip
(white)unconnected.

After one night of experimentation, the downside seems to be, even though I
left the Tripmate powered from the truck all night (it only draws about 70
ma), it lost the satellites while parked in the garage, and took a long
time to reacquire them this morning. (Longer than my 7 minute commute.)

I had hoped that leaving it powered up it would reacquire right away.

I have found that it actually works been better if you power it down prior to
losing lock and then power it back up after pulling out of the garage in the
morning.

Looks like you are right. I just powered it down and back up and had GPS
data going to the 700 in about 2 minutes. I didn't think the Tripmate could
hold its last position like it appears to.

Thanks!

Chris KD6DSI

Rendered body type: text/plain

Hi All,

I'm not aware of the existance of a manufactured right-angle product, but
I'm planning to solder up my own, using a right-angle PCB-mount connetor
(male, for purpose of explanation), and a standard solder-cup connector
(female, again for explanation). This should result in an adapter with the
90-degree bend along the long dimension. The pins on these should line up
(or be close enough) to allow fabricating your own. I found the connectors
at a Portland, OR retailer for less than $1.50 each.

This is so I can vertically mount a KPC3+ into a military 50-cal ammo box.
The TNC is tall enough this way that there is not much room below it for a
conventional db-25 connector and cover shell. Even a DB-9 shell has to be
cut down - and a brainstorm at the store suggested this technique. I'm
planning to do both a 9-pin and 25-pin of each. I'm sure that other places
(digikey, etc.) have the same style connectors - but I had the idea while
looking at connectors hanging on pegs, and couldn't let the idea get away!

Hope that idea helps someone!

190. [htaprs] 2.5 mm Jack for GPS input

From: "James Kalkowski" <toast@portone.com>
Date: Wed, 12 Jan 2000 14:58:49
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-60061-2000.01.12-15.15.07--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last week, I posted a message about the unavailability of the 2.5 mm jacks locally and I planned on ordering several if there was enough interest. These are the jacks used with the TM-D7A and TM-D700A for the GPS input (and I think for a PC interface on the TM-D7A). I got plenty of email regarding these and I did place and order that I received today so here's the deal. I ordered 2 types of jacks. The 1st is a 2.5 mm jack with a 90 degree plug and 6 feet of wire. The second is simply a solder on type with no wire attached. I placed the order with www.mouser.com and the part numbers for each are:

Jack with 6 feet of cable 172-2010
Solder on jack with no cable 171-3305

If you have any questions or doubts as to what these jacks look like, please go to there site and view the Adobe documents for these part numbers. There are very nice drawings as well as measurements and detailed specifications.

If anyone is interested in either of these, please send me an email and in the subject put GPS JACK. The cost for the jack with the attached six foot cable is $5.00 and the cost for the solder on jack is $3.50, shipping included. Send me your mailing address and callsign and I will send them out right away on an "honor system". I will include my address in the package.

192. [htaprs] D700 commands (followup)

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Wed, 12 Jan 2000 21:24:41 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-60126-2000.01.12-21.40.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am still diligently working on expanded information about the D700 commands, but here is a little teaser until I can get more done. First off, you don't have to enter AI 1 to *control* the radio... you can type commands to the radio while in AI 0 mode and it will echo back responses to what you

typed (at least for vaild commands). AI 1 turns on the *output* of data
over the serial port... allowing you to watch all kinds of commands and data
zip by as you operate the radio. This works in APRS mode or with TNC off...
packet mode doesn't support these commands.

A sampling of APRS data spit out as each station comes in and is put in the
Station List:

LIST 01,AJ0A,0112,2020,6,4109150,09603581,/,_, ,,------,Papillion, NE -

193. [htaprs] D700 messages over serial port

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Wed, 12 Jan 2000 22:35:23 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: "Bob Bruninga" <bruninga@nadn.navy.mil>
Message-ID: <LYR845-60142-2000.01.12-22.51.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Bob and others,

The command

AMSG 00,CALLSIGN,TEXT

allows you to enter a message into the D700 memory over the serial port for
queuing and sending. Problem is, *most* of the time (still researching to
see exactly under what circumstances) when you enter the message in this
way, the message will not send on its own - it will just sit in the memory
list as an outgoing message with (5) message sends remaining. Using the
control head, if you select the message in the list, cancel it, then RE-TX

it, then it will send. Or select TRANSMIT from the MSG menu, it will send that way also (this sends any messages that are still queued that have not expired or been acked).

Again, however, this is the behavior of the radio *most* of the time. Occasionally, you can enter a message using the above method, and the radio will queue it and transmit it right away. However, I have found that if the MSG list is *full*, at no time could I get the above message entry method to work... you had to manually DEL messages from the MSG list to make room for another message, then you could try again.

Another odd thing is that after entering a message through the serial port, and watching it sit there with (5) sends remaining and it won't send on its own, it will mysteriously send on its own only after a *long* time has passed (like maybe 20 minutes or so). There doesn't seem to be any rhyme or reason as to why it finally sends on its own without intervention - it's not simply hearing the target station then deciding to send like some aprs versions do - there's no obvious reason or time amount.

If anyone else plays with this capability, let me know your outcome. I want to see what you have to do to make the message send by itself without intervention after you have entered it over the port.

194. [htaprs] Annoying D700 features - KENWOOD PLEASE READ!

From: Jon Ogden <jono@enteract.com>
Date: Wed, 12 Jan 2000 22:38:00 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-60144-2000.01.12-22.53.23--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK,

It's time for an annoying list of D700 features or lack thereof:

1.) Not being able to put UHF in band A and VHF in band B at the same time. You can run VHF/UHF, VHF/VHF, UHF/UHF, but NOT UHF/VHF. This is annoying because I would like to monitor aircraft frequencies AND my VHF/UHF repeater memories. The B band VFO only covers down to 137 MHz. So in order to monitor aircraft, you need to operate on the A band. OK, so the A band will cover 118 MHz band, 2m, and 440. Fine. But again when on band A, you can't monitor UHF if band B is on VHF. I want band B to be on VHF so I can listen to aircraft frequencies and operate on APRS at the same time.

Kenwood, I know you read this list. This was really stupid. I don't know why both receivers don't cover 118 MHz to 1.2 GHz. It's so confusing: let's see if I want to monitor such and such a frequency which band do I have to be on? Oh, gee, but then I can't do this on another frequency. Sheesh for a radio that costs nearly $700 you'd think they could make both bands with ultra wide receive.

2.) Wish the mic keypad had the same functionality for the keys as the TH-D7A. It would be nice to press the number "2" to turn the TNC on or off instead of having to press F for one second and then press TNC. Then to turn it off, you have to press F for one second and press TNC again. OOPS! Now it's in packet mode. SOOOOO.....press F for yet another 1 second interval and now you can turn off the TNC all together. DUMB!

3.) Re-arrangement of the function keys on the bottom of the display. There is no way to have the APRS keys be the second set of keys (press F less than one second) and the standard first function key display to still be first. Sure there are three different function key orders that you can have. But that does not cover all the different combinations of arrangements that you may want. Another dumb move.

It's also frustrating to put all the APRS function buttons on the first screen, yet your TNC control is still in the "press F for one second" screen.

4.) Cannot use the VISUAL band scan when the TNC is turned on. Have no idea

why, but you can't do it! The radio just beeps at you!

5.) All beeps are the same tone. My Yaesu FT-7400 has different beep tones for each different key. It's much less annoying that way.

6.) Can't transmit on both bands at the same time.

7.) No true carrier detect in the TNC

8.) Transmitting APRS on 2m packet interrupts UHF reception. Yet UHF transmission doesn't interrupt 2m reception. Go figure.

9.) TNC still requires S-meter to be full scale or nearly so in order to decode packet. Much like the most annoying feature of the TH-D7A.

10.) When trying to name a memory channel you have to first go into memory mode then step through all the menus to name the channel. You have to go through this with every memory channel you want to name. Can't just name them all together from a menu. Individual naming could be done easier too.

11.) You can't have the radio displaying your GPS postion (which is a TOTALLY cool display) and talk on the radio at the same time. I'm not even sure it will send APRS beacons.

12.) Not sure what value remotely controlling the radio is (via a TH-D7A or other radio). I thought that it would be useful in that you could turn the crossband repeater function on or off. Well you can turn it on remotely and you are supposed to be able to shut it off remotely as well. But shutting off remotely doesn't work. It just crossbands your DTMF tones!

13.) Having only 5 PM (Parameter Memory) slots.

OK, now I think that covers all the little quirks so far. Don't get me wrong. It's a totally cool radio and it has some really neat features like being able to control a LOT of the radio's functions from the microphone keypad. Or having the "PM" memories to store different sets of operation parameters. I am still glad I bought the radio. It's just got these quirks.

Perhaps Kenwood can fix some of them (as a lot of these are firmware related) and give us a free firmware upgrade. As to the operation of the VCO's and bands, I have no idea there. Guess that would likely require hardware change.

Oh well....what else has anyone found?

> You can run VHF/UHF, VHF/VHF, UHF/UHF, but NOT UHF/VHF.

I can put aircraft (commercial or military) on band A, and VHF or UHF ham or wideband on band B. You can program all of your memories in any combination of frequencies, and switch to VHF or UHF ham freqs in band B while on aircraft in band A. Also if you want to monitor VHF aircraft on A and do APRS on B, just switch the data band to B. I'm not sure if I'm

misunderstanding your intentions, so correct me if necessary. Just hit [F] [Band select] while in VFO mode on either side to rotate through the available VFO bands on each side... then store that in a memory. I'm using a wide combination of different freqs in both sides, including monitoring 224.94 on left side while doing APRS with data band B on the right, lots of options available.

> I don't know
> why both receivers don't cover 118 MHz to 1.2 GHz. It's so confusing

It is kind of annoying to have to be in the right VFO for the right range, etc. But I have found this radio is horribly noisy in the typical intermod alleys so I guess there is the tradeoff.

> 2.) Wish the mic keypad had the same functionality for the keys as the
> TH-D7A. It would be nice to press the number "2" to turn the TNC on or off

Program one of the four PF keys to the TNC function. See page 62 in the main manual. There are 36 different radio options that can be independently assigned to each of the four keys.

> 3.) Re-arrangement of the function keys on the bottom of the display. There
> is no way to have the APRS keys be the second set of keys (press F less than

Well, I have my APRS keys first, guess they just missed having the few extra options to get the keys in the order you want. APRS buttons up front work well enough for me most of the time. Other option: set the KEY FUNC option to the Best possible option; then use PF keys to cover the last few items you need single click on.

> 4.) Cannot use the VISUAL band scan when the TNC is turned on. Have no idea
> why, but you can't do it! The radio just beeps at you!

Hmm, haven't played with that much yet, still playing with control over serial port!!

> 8.) Transmitting APRS on 2m packet interrupts UHF reception. Yet UHF
> transmission doesn't interrupt 2m reception. Go figure.

Interesting... hadn't noticed.

> 9.) TNC still requires S-meter to be full scale or nearly so in order to
> decode packet. Much like the most annoying feature of the TH-D7A.

Doing mostly pretty well here with a Diamond dual-band gain antenna, but it is annoying to be on a fringe area and be able to "hear" the packet but it won't decode. But I had that with my KPC3+ also; I guess it would be worse at 9600.

> 10.) When trying to name a memory channel you have to first go into memory
> mode then step through all the menus to name the channel. You have to go
> through this with every memory channel you want to name. Can't just name
> them all together from a menu. Individual naming could be done easier too.

Just do it from the serial port. Hook the radio to your computer, fire up terminal.exe or hyperterminal, then type

```
MNA 0,001,APRS
MNA 0,002,W0XXX
MNA 0,003,N0XYZ
```

etc

where 001 002 003 is your memory number. Works like a champ. Lickety split.

> 11.) You can't have the radio displaying your GPS postion (which is a
> TOTALLY cool display) and talk on the radio at the same time. I'm not even
> sure it will send APRS beacons.

Yes, it will send beacons but if you key up to talk it erases the display before you actually key up. Hmm. Just like the D7 where you had to press a key to clear the screen of any non-frequency display.

> 12.) Not sure what value remotely controlling the radio is (via a TH-D7A
or
> other radio).

I played with this a little bit, didn't spend a whole lot of time with it.
Mostly will probably use for crossband repeat, etc., but will research this
and put some info on my page when I get time.

> 13.) Having only 5 PM (Parameter Memory) slots.

Yeah, the PM is the *most* useful new feature in the series. If they had 5,
maybe they could have done 10. But I dunno what the memory (Kb)
availability in this thing is... at least it does good with serial port
control, so as soon as software comes out, that may help a lot in turning
this radio into a True "Sybill" (old movie reference).

> It's a totally cool radio and it has some really neat features like
> being able to control a LOT of the radio's functions from the microphone
> keypad.

Don't forget the serial port at 9600-n-8-1 with *ANY* ascii capable terminal
or handheld!!!!!

> Oh well....what else has anyone found?

See http://home.netcom.com/~jimgill and I am adding more when I get time,
probably won't have more until late in the weekend.

Jim -

Thanks for providing such a convenient service to the TH-D7-carrying
amateur radio community.

It's funny, we tend to be such a tightwad bunch that while we might be
willing to pay $10 for this cable at a hamfest, we can't stand to pay $3
for the cable plus $7 S&H! to get it mailorder! Yet we'll drive all over
town trying to find one locally for $5 and spend a whole afternoon plus
$10 in gas (and don't forget $5 at MacDonald's) trying!

My beef with this is that you can't listen while you are VISUAL scanning...
I think it would be useful to be able to tune to a bar you see full scale,
and have the radio STOP at that frequency and play it, then resuming the

VISUAL after the squelch closes. Perhaps I'm not understanding the design
of how this feature works anyways.

Jim

> options available.

The problem is that if you want to run APRS and scan through all your
aircraft and ham memories you CAN'T do that! You can only receive aircraft
on band A. Right now APRS is only on VHF. Sooo....your data band would
need to be band B in order to receive air band on band A and still send
APRS. But then you can't receive UHF frequencies. I mainly use a UHF
repeater.

You cannot do UHF/VHF. The manual even says it.

Good point. It just looks kinda pretty on the display!

Hey, have you tried REVERSING the display? It looks REALLY cool and is much
easier on the eyes at night.

Jon -

I have the same frustration with a TM-V7 and a TH-D7. They seem almost
as if they are arbitrary restrictions, though there may be some sense to
it. First of all, no manufacturer can make a wide-band receiver in this
size factor without sacrificing selectivity and intermod rejection. I
find this true of the receivers in both of the above radios.

DC to Daylight coverage is neat, but anyone that owns a Yaesu VX-1 or
VX-5, or the IC-T8 will tell you that with the wide range you get lots
of unwanted stuff you're not even tuned to. When I'm in crowded urban
downtown areas, my receiver regularly squawks with combined pager,
cellular, and dispatch radio transmissions. That's what you get for
under a $1,000 in a two-way transceiver. Of course, you won't hear a
Moto rig do that in a police cruiser, but those radios go for $2000 and
up (and they still don't do DC-Daylight).

My guess is that Kenwood is delivering the best balance of RF
performance and software flexibility that they can, and that's what
works in their case. It's a judgement call, but as a comparison, I hear
lots of Yaesu FT-8100 owners who hate the intermod rejection (or lack
thereof) but the receivers go 50-1300MHz on either side.

You won't hear me take Kenwood's side very often. I have a whole litany
of complaints about the TM-V7, but that's for another reflector... :-)
In this case though, I have to assume they have made the software as
competitive as possible. After all, that's the easy part of the radio to
tweak! It's the RF parts that are so hard to design.

Sounds like you are demanding that it operate VHF/VHF/UHF
simultaneously... THe radio only has 2 sets of hardware...

Yeah, I know. I sell them some of their receiver mixers. You wouldn't
believe the specs!

It's a very good point. You're right. Having to use different VFOs for
different bands is not so much the rub. It's that I can't do UHF in band A
and VHF in band B. I can do that on the TH-D7A, but not on the TM-D700.

No. Let's look at it this way:

If I am in UHF (440 MHz ham) on band B, on band A I can scan Aircraft bands,
VHF ham and UHF ham. In other words, it will operate in Air/UHF, VHF/UHF or
UHF/UHF.

However, if I put a VHF frequency in band B, all I can monitor on Band A is
AIR/VHF or VHF/VHF. I CANNOT DO UHF/VHF. The manual even says so.

>the like. I would like it to be in Colorado but can order out of state if
>need be. Any information can be mailed to me direct or to the lists.

I don't know if it's a good source, but I just bought some from:

RT Systems 1-800-723-6922 in AL (or 1-800-387-8570 in FL)

pg. 63 of catalog:

SMA Male to BNC Female
SMA Female to BNC Female
SMA Male to UHF Female
SMA Female to UHF Female

all $3.49

SMA Male crimp to RG-58 $2.75

Those were the only choices however.

Yesterday I happened upon D&L Antenna Supply Co. (www.wavehunter.com).
Their website is a little confusingly organized but the product list is at
www.wavehunter.com/list.htm. They have a selection of SMA antennas, SMA
adapters but most interesting to me was "connector saver" which is a
pre-made 48" RG174 cable with SMA Male on one end and UHF Female on the
other. They advertise it for as an "extender or strain relief cable".
$9.95 + $1 shipping. Looks like the ticket for being gentle to the SMA
connect on my D7.

Hi, Jon -

> It's that I can't do UHF in band A and VHF in band B.
> I can do that on the TH-D7A, but not on the TM-D700.

Jim already beat me to it, but I am curious how you get a D7 to do UHF on the A side. That's one of my chief complaints about the D7 is that the A side is limited to aircraft and VHF, while the B side is limited to VHF and UHF, but in VHF, won't tune to a memory channel outside the 144-148MHz ham band! It skips right past them.

Much like your complaint about the D700, it's not that you can't more-or-less get where you want to be, it's that certain combinations are impossible.

Another thing I don't like about the D7 -- if the B side can work on either VHF or UHF, and memory locations are common to both sides and bands, why do you have to "switch" the B side between VHF and UHF bands? IOW, if memory 21 is a VHF preset, and memory 22 is a UHF preset, why can't I tune from 21 to 22 without first switching the band? If I'm not switched to the right band, it skips past the all the memory locations that are in the other band.

Perhaps the band switching actually changes bandpass filter tuning or something. And again, with all due respect, these radios do an awful lot considering their size and cost. We sometimes get hung up on the things we can't do because the radios are so flexible that they lead one to believe nothing should be impossible.

> Can anyone tell me what programming cable is used?

Mark,
it uses a 9 pin serial cable. The radio side of the 9 pin is MALE so you
will likely need a female to female. Also it is NOT a null modem cable -
just straight through pin-for-pin (or you could use 9pin to a 25pin serial
port on the computer side, depends on your ports).

The default communications setup to talk to the radio is 9600,n,8,1.

I don't see anything specific for managing the seperate PMs within the
software, so I assume you would save different *.700 files for each PM you
want to save, then set the radio to PM NONE when you send a file to the
radio. When it is loaded, you can then copy the PM to the desired PM number
in the radio. Anyone have a better method than this or did I miss something
in the software?

With the recent release of the TMD700 software by Kenwood, we now have an
easier way to deal with the tedious task of programming the many options on
this radio. Also, it makes knowledge of the specific control and
programming commands unnecessary for most users.

However, I'm sure the demand is still there for some sort of real-time
control software, although the number of users needing this information will
likely be smaller now.

NOW, the question is, who among us would like or need me to continue the
work on documenting the D700 command set so I can decide how much time I'll
need to devote to the project? If no one is going to use this info, I won't
go to the trouble to compile and post it... I'd simply just continue to use
it myself. However, I do enjoy doing this, so please speak up if you want
to see the work continue (those who've already told me their prefs -
thanks - you know who you are).

Reply by direct email if you think that is more appropriate.

What I am trying to do is start a list for the hamfest notification, not hamswap, my mistype generated a lot of response from all and I am sorry if you all have the idea that I was imposing on your own lists for the local area. What I was trying to do is give people the chance to be able to get the word out via email about the different swaps there are, either in their home town or if someone is traveling and wanted to check out a fest elsewhere. If this sounds like a good idea then let me know.

Sorry for the confusion and hope to hear from all of you

Peter

All these complaints...

Well I'd just like to praise Kenwood for making the best dual band handheld radio I've ever owned as far as Intermod, and I've owned a lot of them over the past years.... I am guessing that in order to make the radio good as far as intermod goes they limited what the receivers/radio could do. I feel it is a great trade off if this is the case... Seems to work...

I disagree with the statement that people make when they say a DC - light radio will get more intermod than a radio that covers only 118 - 174 & 400 - 470. This all depends on design, and the sensitivity the DC-light coverage radio has outside of the "normal" bands. I've had DC-light radios that perform great and ones that perform lousy, on the other side, I've had limited coverage radios that perform lousy, and ones that perform great. The one thing that seemed to be common in the DC-Light coverage radios that perform great, is lack of sensitivity outside the "normal" spectrum. There are other factors that come into play with intermod rejection, but something to keep in mind with radios that cover DC-light.

Since I do not own a TM-D700A (yet) I am curious how people are finding them as far as intermod goes.

I tried the software for the D700 last night, but I can't get it to read
the radio. I made up a cable for packet use (which works file, pins 2,3,5
straight thru) - but still can't get it to talk using the program. Ideas?

Which dualband H-T do you own?? I am a little disappointed in the
selectivity of the TH-D7. It is apparently (based on other comments on
this reflector) very susceptible to birdies when located near a PC --
something I personally experience. The birdie is so strong I can't
squelch it out, whether with a rubber duck or external antenna. This
leads me to believe at least part of the interference is being received
due to inadequate shielding rather than through the RF input.

Three other radios -- a Yaesu FT-51, an Icom IC-2100, and an IC-735 are
not affected. As a result, I can't run packet or APRS on my desktop,
because the D7's TNC does not have a true DCD. With an open squelch I
cannot close, the TNC never transmits.

As for "DC-light" radios and intermod, the discussion was focused on the
TH-D7, and for comparison I referred to only three other H-T models
(from various manufacturers), all of which are well-known for intermod
susceptibility in urban areas. I'm not saying a super-wideband receiver
can't be built with great intermod rejection, the IC-R7000 and
comparable desktop receivers are superior even to many single band
receivers. I only meant that it is hard to do in a palm-sized H-T.

YES, it all has to do with filters. We went through all this compliaining
on the THD7, and the facts are simple: The radio contains two receivers,
But if you start requiring that one shift both the front end filters, and
IF filters around between all possible combinations, then the radio
requires a heck of a lot of filters and switches. The specs and
FCC/International channel requirements require different filters for VHF
and UHF and different filters for USA and foreign. And different filters
to optimize for the 440 band (usa) or the Satellite band (430). And
different filters for out of band tuning.

Yes, it can be done. Watkins Johnson does it, but gets about $50,000
per radio. You aint gonna get it in a $600 HAM radio.

Kenwood Put the best filters for the given band, but then does allow us
wideband use of those two receivers... Today driving to work, and
monitroing on my Kenwood on a 2 meter Whip, I tuned in the 9600 baud
packet downlink from one of the Microsats and copied about 2 minutes of
data. Neat. Thanks kenwood...!

Rendered body type: text/plain

Hi there !

I am trying to make my TH-D7 to work on TCP/IP over AX25

Has anyone ever succed doing this ?

I have heard about a bug or something on the KISS mode
of the built-in TNC, or a mismatch with the XON/XOFF flow control...

Maybe ETHRAX25 can help ? (but in KISS mode only ...)

Thanks,

Olivier SANTIANO / F1EFQ

Olivier -

I recently began this same experiment, using JNOS running under MS-DOS.
I have only had a couple of hours to play, so I have not advanced very
far yet. I have succeeded in getting the TNC to transmit TCP/IP packets
out, and AX25 mode seems to work OK still.

Due to the TH-D7's susceptibility to EMI from the computer, I am
fighting another problem (the TNC won't transmit while the receiver is
detecting any signal, whether or not it is packet data).

I was not aware of any bug in KISS mode, but that may be a stumbling
block that will be hard to overcome. What is ETHRAX25?

Sorry I am more problem than help, but I am new to this as well. I hope
you get some more informed replies.

Too bad the lack of real DCD in the TH-D7...

ETHRAX25 is a "packet driver", modified version of packet driver ETHERSL
(http://www.CRYNWR.COM)
by K8LT (http://www.mv.com/users/grebus/) to use a TNC in KISS mode as an
"Ethernet Interface" useable
with a Winsock TCP/IP Stack under Windows.

I'll try to make more tests under Windows.

Hope not to be too much "out of th subject" on this APRS mailing-list, but i
don't know any other TH-D7 mailing list...

Thanks,
Olivier.

Don't get me wrong. I REALLY do like the TM-D700. It is a great radio and
believe me, I understand why they put limits on what frequencies you can
receive on which VFO. Perfectly understandable. I would rather have that
then intermod problems!

And yes, I find the TH-D7A to be really good in terms of intermod.

Perhaps I should have rated my gripes on the TM-D700 as major or minor. The
only really big one that is my biggest gripe is the inability to receive UHF
on VFO A and VHF on VFO B simultaneously. Other than that, most of my
gripes are really minor and I am not sorry about buying the radio. Perhaps
I should post a D700 AWESOME features list because it really has some cool
stuff. REALLY cool stuff.

And to those that wonder about "bugs" in the software or what not: I can't
find any. The only feature that I have found that I can't make work is
turning off cross-band reapeater functions via remote control. And I didn't
play with it that much.

The problem I have observed it that when you cycle power on the radio, it comes out of KISS mode. Software that works in KISS mode on the D700, needs to be aware of this.

Hi Mark

It's a male DB9 on the radio and so you need a cable with a female DB9 on one end and the other ent to match up with your serial port. Typically also a Male DB9 and thus you need a Female DB9 on that end also. I got my Female-Female DB9 cable at Radio Shack

Good Luck

program.
> Ideas?

Hi Bob

I used a RS cable which has all of the pins wired straight thru - not a
null modem - and it works fine.

I did have one problem in that I was on line via my modem on Com3 and
tried to use the program on Com1 and it would not work. Hung up the
modem and the program worked fine. A classis IRQ problem...

Anyhow, Program works fine here

Hi Jim

Please DO KEEP ON with this work. Lots of applications will require this
framework.

I can see smart digi's using this info. I saw your stuff and was
thinking about writing some procomm scripts to interact with a user thru
menu's and set other things in the radio.

Thanks in advance for all your work.

Why reinvent the wheel? Go to RadioShack, get 26-152 - DB9 female to DB9 female. $9.99. If you need 25 pin on the computer end, you'll need a $6 gender bender. RS doesn't sell a DB25F to DB9F (at least it's not in the 2000 catalog - page 289).

Jon Ogden <jono@enteract.com> wrote:

>You cannot do UHF/VHF. The manual even says it.

Your $700 radio would turn into an $800+ one. Optimized VHF + optimized UHF
+ wideband front ends on each side means you'd have 6 RF front ends in the
beast. That's a pretty silly design concept, you'd have to admit. Or you could
instead have only a single, broadband front end on each side - and a useless radio.

A far better solution is to open up the broadband front end of the right side only,
there'd be no parts count increase.

I can't do UHF/VHF on my Yaesu 8100 either; I wonder if any dual banders can do
it. Personally, I think that broadband front ends are usually only good for very casual

listening (your aircraft band monitoring might fit this description).
They're highly
susceptible to images and intermod. I can usually pick up an image of
airport comms
at their frequency + 2x the IF of the opposite VFO. Give that a try,
it could solve your
problem! <g>

I have been having the same problem with intermod on my TH-D7 as the rest
of you. I went to AES and bought a Par Electronics Intermod filter
(VHFDN152HT) for $70.

Being a paging technician, I am constantly traveling to the towers. With
the filter installed, I no longer have intermod even when running a preamp
and sitting at the tower sites. This filter works good on 152-158 MHz
signals.

My house is 1/10 mile from a radio tower with lots of business repeaters
and 157.74 MHz paging. I have intermod on any radio. I tried the HT filter
on my home radios and it solved my problems.

Par Electronics makes another model (VHFDN152) that will work on the
TM-D700. Price is $63. They make another model with an extra can to knock
out 158 MHz more (VHFTN152-158). I've ordered 2 but they are on back
order.

Don't expect miracles out of such a small and wonderful radio. Check out
and buy the filter and you will go back to loving these radios.

Wow, Just 5 minutes ago, I finished connecting my D700 to a telnet port so
that it can be used remotely in support of tonights launch of several new
Amateur Sateillites. The builders in Arizona will be able to remotely use
my radio (9600 baud TNC) to see the early passes over the East coast via
the internet and control doppler and see the packets (I hope....)

Yes, the control port is secret. No, you cant have it <grin>

But it does show where the marriage of Amateur Radio and the internet is
HERE TO STAY (Except in the UK)

Yep. The Alinco DR-610 -- which, BTW, gets my vote for most intuitive
user interface on any dual-bander. And it kept track of two VFO's for
each band on each receiver. That meant you could quickly pop among 8
preset frequencies in VFO's alone by pushing only one button! I didn't
spend enough time playing with it to see what selectivity was like, but
owners seem to love 'em.

(Of course, I own a TM-V7, but that's another story...)

Rendered body type: text/plain

A couple weeks ago I flew from Las Vegas to Chicago on United sending
APRS packets every 5 minutes. Actually, that wasn't planned. I put my
D7 in a pocket in my computer case - turned off, of course. No plans to
use it from the plane. When we got to Chicago and I was putting the
case in the car, I heard a packet come out of the case. It appears the
on/off button got pushed somewhere along the trip and it was blowing out
posits every 5 minutes! (oops!) Well, we didn't crash or get lost. I
doubt if the packets got anywhere from inside the plane under the seat.
But, just a word of warning if you're carrying your D7 on the plane -
you may want to pull the battery off before you leave!

244. [htaprs] D700 - Remote Control + cross band repeat

From: "Bob Oesterlin" <oester@rconnect.com>
Date: Fri, 14 Jan 2000 15:11:13 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-60540-2000.01.14-15.27.40--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With my TMV7A, I could easily get it into remote control mode *and* have
cross-band repeat enabled. Really neat with the D7A! Now, with the D700A, I
can't seem to do that. I can get into remote control, or into cross band
repeat, but I can't seem to do both. I tried the "repeater on/off" remote
code, but that seems to have no effect.

Does anyone know if this can be done - or what the correct what to set this
up is?

Edward, mine is in constant use 2 inches from my monitor and the 4 PC's are no
more than 2 feet away. NO interference. Don't use a rubber ducky though and the
radio always runs off a 300 ah battery powered by 200 w of solar panels. You
probably have cabling problems. BTW, not one added filter on any cable.

OK, people aren't listening here!

These are the modes you CAN do on the TM-D700A:

VFO A	VFO B
VHF	VHF
VHF	UHF
UHF	UHF

So BOTH VFOs/front ends ARE optimized for UHF work or VHF work. BUT you
CANNOT do

UHF	VHF

That is the rub!

Bob,

I have gotten the remote control to work with the TM-D700A and the TH-D7A.
I was able to turn ON the cross-band repeater option. However, I was unable
to turn it OFF. The code just kept getting sent through the repeater.

There could be a bug in the firmware on this one.

>So BOTH VFOs/front ends ARE optimized for UHF work or VHF work

"Enabled", yes. "Optimized", I doubt it. The left and right VFOs on
my FT8100
may be a useful demonstration:

Left Side = excellent on VHF, loosey goosey "scanner" performance on
UHF.
Right Side = excellent on UHF, loosey goosey on VHF.

You like good intermod rejection? Or do you like wide band coverage?
Pick one.
Your tuning and band assignments will be accompanied by changes of
the signal
path in the radio, if the designers did their job right.

You're impossible, Tony. The VFOs in the radio ARE what they are. BOTH can do VHF and BOTH can do UHF. So there is NO reason why you cannot do UHF on band A and VHF on band B. I would like a good explanation rather than the "Well, gee you wouldn't have good RX performance if you could do such a thing." stuff I've been hearing here.

Again (perhaps people with knowledge of the TM-D700A should comment), BOTH VFOs will work at VHF and both will work on UHF. So my comment has nothing to do with performance. It has everthing to do with which VFO you assign to which band and the combinations thereof.

Can someone do a little more than speculate? I am not trying to be a smart ass, but it's a real question. I doubt I'll get an answer cause all Kenwood can do is send form letters back to you when you send an e-mail to a real person. And the service techs there probably don't know either. It's a silly feature that doesn't make a lot of sense in the way I see it. Perhaps there is a good HARDWARE explanation lurking about, but this stuff about optimized VFOs and IM isn't cutting it. I am an RF engineer. I understand all that and the trade-offs and needs of proper filtering, etc. I am looking for a discussion of the design of the RF hardware and if that's the reason or if it's some silly software design.

Jon -

The reason for much of the discussion (and speculation) is that among
dual-receiver dual-band radio radios, it's very common for manufacturers
to "optimize" one receiver for 2-meters, and the other for 70cm. This is
visibly evident in the receive sensitivity specs of the two receivers
when tuned to their "non-optimum" band.

What is "optimized" is the front-end bandpass filtering, between the
antenna input and the first stage of amplification. By selectively
filtering the frequency range that can pass through, the RF gain can to
be maximized without creating intermod (receiving the product of two or
more mixed radio signals) and image reception (receiving a frequency
that is above or below the tuned frequency by double the 1st IF mixer
frequency).

This is the classic balance designers must strike between receiver
sensitivity (hearing anything at all) and selectivity (not hearing what
you don't want to). The "tuned" characteristic of a radio receiver is
what distinguishes it as a signal amplifier from the way an audio
amplifier amplifies all audio frequencies without discrimination.
Without relatively high selectivity, the receiver would "hear" lots of
different signals at once. So, as a result of tuning the VHF side
bandpass for a fairly narrow range of 142-150MHz for instance,
sensitivity at 440MHz is understandably reduced. But without the
filtering, strong nearby radio and television broadcasts would overwhelm
the receiver.

Now what would be really cool is if the receivers had switchable or
software-tunable bandpass filters so that when you switched a receiver
out of band, its bandpass characteristics shifted in unison. And, in
fact, HF rigs and top-of-the-line receivers do just that. Now, whether
it's feasible to do build this kinda design into a mobile or H-T, and
what would it cost, are other questions.

I think it's healthy to keep in mind where dual-band rig evolution came
from. It started with packaging two, completely discrete receivers into
a box with a single transmitter module. The receivers could not tune out
of band -- period. At the time it was just cool to cover two bands with
a single radio.

Then we decided "Hey, we could tune the receivers out of band, even
though it would result in less-than-spectacular performance." Now, we're
expecting to go one major hurdle beyond that and design a receiver
module that can cover bands across two octaves or more, with no
degradation in performance. It can't be done for $500.

Why didn't Kenwood give us total flexibility with D7 and D700? I don't
know, but I suspect that if they could have figured out how to do it
without embarrasing results, they would have.

I'm guessing they shot way higher with the design spec of the D700. They
just couldn't achieve everything they went for in the time they had to
get the radio to market. Given another 8 months, maybe they could have,

but then Icom or Yaesu might have come in with their next rig and blown
Kenwood out of the market.

Rendered body type: text/plain

Could someone try to do locked band repeat?

I have the following scenario and I get a "muffled" signal and I also get
noise from the GPS data into the audio line.

I have my D700A in LOCKED BAND repeater mode (which only repeats 440 inputs
onto 2m).

Band A on 146.620-.
Band B on 445.300.

Whatever audio is transmitted on 445.3 is retransmitted on 146.020.

I get reports that my signal is muffled and noisy even though if I use the
mic on the radio from the same location with the same power, my signal is
fine.

I am curious if someone else has the same situation. Please bear in mind
that I am not using the CROSS-BAND repeater function so the D700 only
transmits the 445.3 signal onto 146.6020. The 146.620 signal is picked up by
my HT and the D700 does not retransmit that signal. (Keep the latrine
lawyers at bay!)

Thanks,

Tom

> when tuned to their "non-optimum" band.

Ed,

All of your discussion and everything was correct and all very good. Trust
me, I understand the problems of wide band receivers, need for filters, etc.
It is obvious Kenwood did this with the design of the radio in that VFO A
covers the aircraft band through UHF while the B VFO covers 2m through 1.2
GHz in various segments. It is also clear they had this in mind as you
actually select different "bands" in which you tune be it 200 MHz, 300 MHz,
etc. This is a smart design concept.

Again, I understand that. What I don't understand is why both VFOs do TUNE

and OPERATE in the 2M band and in the 440 Band yet you cannot have a 440 MHz assignment in VFO A and a 145 MHz assignment in VFO B!

Yet I can do this:

A B

145 440
145 145
440 440

No one has given a satisfactory explanation as to why you can't do the fourth combination or 440/145. It's possible no one knows so some answer is better than none.

It makes sense in the TH-D7A since you CAN'T do UHF frequencies at all in VFO A (I forget if you can if you shut the B band off). It is clear that VFO A in the TH-D7A is no at all optimized or capable of UHF operation. However, in the TM-D700, VFO A is clearly capable of UHF operation and VFO B is clearly capable of VHF operation.

So I don't consider any of the answers that I have heard to be satisfactory. That's fine. Until someone with real knowledge of the design of the radio (ie: Kenwood - but all they can do is send form letters to you and the techs probably don't know) or someone with a copy of the service manual who knows how to read schematics comments then I don't think we have an answer.

Well... there are advantages to each platform, and enthusiasts who use either or both platforms. Unfortunately (or fortunately if you are a Palm user), the Palm has one advantage as far as APRS goes, though not for long. (Keep reading). The Palm actually has a released, working version of APRS (pocketAPRS), whereas, I haven't yet released APRS/CE. However, I stated about a week ago that APRS/CE will be in beta within two weeks. I plan on making that date. If you like the color CE platform, and are willing to deal with some of the pain of beta software until version 1.0 is ready, go ahead and purchase the CE box. (I can assure you that my beta software will be far less painful that what some larger, unnamed software companies call "beta".)

All that said, you certainly won't be making a mistake by getting a Palm, Mike's software is an excellent piece of work.

As far as maps go, you'll be able to use either Win/MacAPRS maps *and* pocketAPRS maps on APRS/CE.

The Palm can use pocketAPRS maps (obviously), but I'm not aware of any way to convert a Win/MacAPRS map to pocketAPRS format. That doesn't mean it doesn't exist. Perhaps if Mike is lurking on the SIG, he can answer this one definitively.

Feel free to contact me if you need more details...

Jon -

> So I don't consider any of the answers that I have heard to be satisfactory.
> That's fine. Until someone with real knowledge of the design of the radio
> (ie: Kenwood -

Yep. And I wasn't trying to make yet another speculation. Sorry if I
sounded condescending. FWIW, my TM-V7 has the same limitation. V/V, V/U,
U/V, but no U/V option. I don't know if it's arbitrary or not. But like
I said, it would surprise me if Kenwood had not tried this option, since
competitors' rigs will operate in this configuration. I'm going on the
presumption that they hit a design snag of some sort that they didn't
want to expend resources to conquer.

Especially since the TM-V7 has been out for a couple of years now, you
would think that they have had enough time to rectify whatever is the
problem. On the other hand, maybe it is entirely arbitrary, since it is
contrary to what might be considered logical operation (i.e. using both
receivers in their non-optimum band). The ability to tune aircraft on
the A side may be considered almost a superfluous feature (but now I'm
speculating...)

Good luck in your quest. Kenwood can seem kinda goofy with their
responses. Though they apparently monitor this reflector, they only seem
to engage in commentary if they can show Kenwood in a good light. This
may be a corporate thing. But acknowledging a design obstacle may not
qualify, if this is their policy.

Well, it's interesting, I just looked at an ad for the Yaesu FT-8100 and
they advertise dual receive:

V/U V/V and U/U

They don't offer U/V either.

So that tells me that it isn't just arbitrary.

> Well, it's interesting, I just looked at an ad for the Yaesu FT-8100 and
> they advertise dual receive:
> V/U V/V and U/U
> They don't offer U/V either.
> So that tells me that it isn't just arbitrary.

Odd... The FT-51R HT has essentially two completely independent
receivers. Even the memory presets are separate. No problem with U/V or
any combination. You can even split the Tx and Rx frequency cross-band,
i.e. Tx on 440 and Rx on 144. Yet the sensitivity noticably favors their
"proper" band. But I guess this is a rig still based on the early
dual-band constructions where you basically had two completely separate
receive modules in the same box.

I pulled the spec sheet for 8100 and noticed that the first IF frequency
is different for the VHF and UHF receivers, which also would account for
some degradation of performance when operating outside their preferred
band.

I am sure the Alinco DR-610 can work in U/V. This is another very
flexible rig receive-wise. I don't remember if memories were shared; but
if not, it might indicate that the receivers work completely
independently.

I also pulled the spec sheet for the Icom IC-2710. They claim that the
two receivers actually have separate RF sections for operating in either
band with either receiver with no performance loss -- a total of four RX
sections! (I'm quoting.) I don't know if they carried this over to their
new IC-2800 with the color screen.

Anyway, we're veering pretty hard off the focus of the reflector, so I
better shut up.

265. [htaprs] GPS/DATA Cable for D700 and D7A

From: "James Kalkowski" <toast@portone.com>
Date: Tue, 18 Jan 2000 22:47:1
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-61384-2000.01.18-23.07.09--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Thanks to all who ordered the 2.5 mm cable. The "honor system" worked out great. I have heard nothing but great news about how nice the cables are compared with the flimsy ones that Kenwood sent with these radios.

I do have a few left over if there is anyone out there who still wants one. Please go to www.mouser.com and look at the PDF file for part number 172-2010 so you understand exactly what these are. They are 10 times better than the ones Kenwood supplies with the D7A and the D700. I also got a lot of email from others who got defective cables with their D700's so I was not alone out there. The cables are $5.00 each including shipping and I do not plan on placing another order any time soon so when they are gone, thats it for me and this adventure.

Email me if interested: toast@portone.com

Rendered body type: text/plain

> Does the Kenwood handheld have the capability of acting
> like a tracker? If so, will it detect channel or data
> and hold TX off until clear?

Yes it will transmit when the channel is clear (or, more accurately, will *not* transmit if the channel is busy, or if a channel on the other band is busy also if you have it configured as such. Same goes for the TMD700 mobile). Although, it is not "True DCD" - if the squelch is merely *open* it will not transmit. It does not actually sense the presence of *data* - just an open squelch. Bad for noisy RF environments... like most large city Downtowns.

> Can it detect an external condition to change TX timing,
> as an example, between driving and stopped?

No, you'll have to manually change the beacon rate when you stop. The TMD700 mobile unfortunately is the same way, but makes it somewhat easier by being able to store 5 completely different "PMs" (programmable memories, or "Identities" if you will) that can have different status texts, paths, beacon rates, etc. for easy retrieval by pressing just two keys.

Both of the Kenwoods are amazingly good radios, and are great to be able to view activity instead of just transmit like a "dumb" tracker. But even "dumb" trackers like the KPC3+8.3 are "smarter" than the Kenwoods in that you can have the automatic beacon timing change when you stop, all hands-off. So there will be a trade-off, you'll need to decide what your intended use and priority will be regarding Kenwood vs. traditional trackers.

I took the D700A to Kenwood to see what the problem was. They
concluded that I probably blew an IC when I connected the GPS to the
radio without powering down the radio. Kenwood replaced the IC and
the radio works fine.

I will be more careful from now on when I connect and disconnect data
cables to and from my radios.

Thanks for the suggestions I received from the group.

Steven

I'm playing with Simple Term terminal program for packet. Seems to
work pretty well without any of the bells and whistles for something

like ARESPACK. As I was downloading several terminal programs at the
same time for testing, I don't remember which site I got it from!
Sorry. Of the ones I downloaded, this was, for me, the simplest, most
intuitive and easy to use. (as well as being free ware!), and is the one
I'm keeping for now.

Peter -

An ordinary comm program, designed for modem control, should work for
AX.25 mode packet. I don't know if one exists for the Pilot, but I'd
guess someone has created at least a simple one.

On a laptop, I can use ProComm Plus for DOS to originate connections and
send e-mail. Some have even suggested using the dialing directory to
store common TNC control strings, like your beacon text and connection
requests.

Good luck & 73

270. [htaprs] Cross-Band Repeater and Remote Control -- Solution

From: "Julian M. Frost" <jfrost@odaiko.ss.uci.edu>
Date: Wed, 19 Jan 2000 12:41:30 -0800 (PST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-61513-2000.01.19-14.58.05--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Some have commented that the Cross-Band Repeater under Remote Control
can't be turned off from the handheld transceiver. Turning the repeater ON
and OFF works fine... but you have to set up the radio correctly first.
Here's how it is done:

TM-D700A CrossBand/Remote Control Setup
=======================================

Select Band A.
        Enter VHF frequency (eg. 146.520)   PTT will be displayed.

Select Band B.
        Enter UHF frequency (eg. 446.000)   PTT will move to UHF Band.

Select Band A again (PTT will be displayed on this band)

On D700A, make sure the secret code has been entered, and set up
answerback...

Menu   1-A-1   Code 000   (or whatever you want)
        1-A-2   On
        1-A-3   On

At this point, the D700A *automatically* sets up the PTT and Control
bands. If you set up the PTT and CTRL bands before hand, it doesn't work
properly -- as we have all found out. The manual isn't very clear about
this.

On the TH-D7A, enter the same frequencies and tones as you did on
the D700A:

Band A: 146.520
Band B: 446.000 PTT (You will be transmitting on this frequency)

Enter the D7's secret code using:
PTT & VFO Pwr On   Code 000 (or whatever you set above)

Turn on the D7's remote control:
PTT & MR Pwr On   Initiate Remote Control

Now, when you press the "C" key on the D7, it'll activate the repeater,
and when you press the "D" key, it'll shut it off. Note that some of the
DTMF tones will be sent out over the VHF frequency. If you are operating
though a repeater on VHF, make sure that those tones aren't going to mess
up the repeater!

Hope this helps.

Hi Peter,
        I've not found any Packet Programming per se, but if you
have ever had any success "doing" packet usinf terminal
software, then I would highly recommend Accessit Ver 1.1,
YAMADA Tatsushi. Just run a search on the web and it'll
appear. Contact me if you have any trouble.
        73 de Jack VA3JAX
                        <snip>

.... But there are some here that would like to know if
there
is a straight packet program for the palmpilot. I have done
some searching on the web and have not found anything yet,
but I am still looking. If someone could point me in the
right direction I would be most grateful.

thanks for the information in advance

I am trying to get the Palm pilot to run the
PocketAprs application. I have the hotsync cable with
a DB9 connector at the other end.

What are the proper pins to connect the jack into the
D7?

Thanks
Steve

There is excellent documentation at http://www.pocketaprs.com
I used the hotsync cable myself, because they no longer sell the modem
cable, and the alternative companies were out of stock. I cheated temporally
by using a null modem cable, until I was able to make a connector.

If you need to save tnc settings, the easiest way is to start a log file
in the terminal window, then do a display command, close the file and
anytime you need to change it just upload a file using ascii transfer.
It will then be uploaded to the tnc. Just like transferring a file. I
use it to set up my KPC-3 for different modes.

Rendered body type: text/plain

Thought I would put my $.02 in after having the D700A in the car for 2
weeks. In summary, it is a cool radio that is lots of fun to use. Random
thoughts:
- Took about two nights of reading the manual and playing with it in the
shack before I had everything programmed and understood the functions. If
you have used a D7A, it's pretty similar.
- Well thought out functions and screen layout on the remote. Very easy to
see day and night. I've been playing with different spots for the remote in
my '97 Jeep Cherokee and found a spot on the console is best. It's an easy
spot to push the buttons at traffic lights.
- I've got APRS in VFO A, and my local VHF rptrs, NWS WX, and a bunch of VHF
and UHF public service channels on B. Like the speed of the scan and being
able to lock out freqs for the scan. Like the alpha function for the
scanner.
- Nice feel to the mike, though I wish it used a regular hook.
- While I was setting it up in the shack, I noticed that the power connector
was the exact opposite of the Kenwood TM-251A! Not a big deal because I
changed to the Molex "RACES standard" connector we use locally. Power poles
will SOON be the standard here, I'm told, once more local suppliers carry
them.
- It's neat that it can tell a D-7A and other D700A's and tell you on the
list; I've just seen one other D700 so far, 161 miles north in Oklahoma.
Nits:
- Wish the altitude could be toggled off on the status; it's never been very
accurate on any GPS I've ever owned.
- While my old Alinco D600 never interfered with my broadcast radio, every
D700A beacon wipes out my FM radio reception.
- Intermod in the city seems to be worse that my old Alinco D-600, even
though I am using the PAR pager filter.
- The remote screen "reboots" whenever I start the car, though the radio
itself does not shut off. I'm using the accessory lighter plug on the Jeep
dash. (I know I need to go directly off the battery; anyone know a spot to
get through a '97 Jeep firewall?)
- I prefer to use the knob to enter letters on a message, but can't generate
a space character except from the TT pad.
- Would like the option to have a full screen display whenever an APRS
packet is received, w/o having to click on Detail.
Problems:
- Have had my POS lock up once while driving, though my GPS continued to
update and the GPS indicator continued to blink on the remote. Turning the
rig off and on cured it.

In summary, two thumbs up from here for a great radio, Kenwood! I love it
even more than my D7!

Mine is velcroed with the strong stuff you can buy at Radio Shack and is
sitting on the top of the dash just above the radio. I have a 98 Grand
Cherokee.

> - Nice feel to the mike, though I wish it used a regular hook.

Go to Best Buy and look in their cell phone acessories area. There is a
thing called the "Tab Kit" which is the standard kind of hook. Just attach
it to the back of the microphone. works good.

> - It's neat that it can tell a D-7A and other D700A's and tell you on the
> list; I've just seen one other D700 so far, 161 miles north in Oklahoma.
> Nits:

Guess, I'll have to put in a few more WIDES! :-)

So far I've seen 3 of us in Chicago. I've sent messages to the other 2 but
they aren't very friendly and have never answered back.

> - Wish the altitude could be toggled off on the status; it's never been very
> accurate on any GPS I've ever owned.

Agreed.

> - While my old Alinco D600 never interfered with my broadcast radio, every
> D700A beacon wipes out my FM radio reception.

Could be a power supply issue and grounding since you are running through
the cig plug. I have the stock Chrysler radio in my Jeep and never have a
problem. Check your grounding.

> - Intermod in the city seems to be worse that my old Alinco D-600, even
> though I am using the PAR pager filter.

Not driven into downtown Chicago yet, but in the RF hotspots around my area,
I've not noticed any problems. You might want to turn the VHF AIP on when
in those areas. Yeah, it decreases sensitivity a bit but it helps with the
IM. If the paging system has spurious or mixed products in the ham band, no
filter will help. The PAR filter should remove signals outside the ham
bands enough so that improper mixing does not occur inside the radio.
However, if something is happening OUTSIDE your radio and there are in-band
transmissions, then nothing you can do will help. Sounds like that could be
a problem. Do a direct comparison between radios. The PAR filter should
help.

> - The remote screen "reboots" whenever I start the car, though the radio
> itself does not shut off. I'm using the accessory lighter plug on the Jeep
> dash. (I know I need to go directly off the battery; anyone know a spot to
> get through a '97 Jeep firewall?)

I am wired directly to the batter. Here's how you do it:

Run a wire out your window and under the hood! :-)

No! Seriously, here is how:

If you go to the engine firewall on the driver's side near the steering
column, there *may* be a grommet or a boot of some sort passing cables that
you can put your wires through. On my 93 Grand Cherokee that is what I did.
When I got my 98, there was NO grommets or anything. Since the guys that

installed my trailer hitch had already drilled a hole in my firewall for the electric breaking system, I thought, "What the heck." So I drilled a hole myself in the firewall, put a rubber grommet in it and run the wires.

Just go ahead and drill a hole. You'll grimmace at first but it's much, much better than your current system and you won't even notice it after a while. Also, improving your ground will probably eliminate the problem you are having with your FM radio. The FM radio and cig lighter are probably on the same ground buss and are picking up RF from your radio. Ground the radio directly to the battery.

The Jeep is the WORST vehicle for mounting any kind of radios!

> - I prefer to use the knob to enter letters on a message, but can't generate
> a space character except from the TT pad.

Push the "Char" button and then you can get it.

> Problems:
> - Have had my POS lock up once while driving, though my GPS continued to
> update and the GPS indicator continued to blink on the remote. Turning the
> rig off and on cured it.

You know....I had this once as well. It became a regular problem for me during the last several months when I was using the TH-D7A. No one had a solution then. And like you, I have seen this lock up on the D700 as well now too. Since two of us are seeing it, it isn't imagination! I'd like to hear other reports as well.
>
> In summary, two thumbs up from here for a great radio, Kenwood! I love it
> even more than my D7!

Agreed. It is a super radio and I am happy I have mine as well!

> accurate on any GPS I've ever owned.

A couple people have complained about altitude inaccuracy in the typical GPS. Maybe Kenwood should think about putting in an altimeter chip such as the optional one available for the mini Yaesu VX-5R HT. See:
http://www.yaesu.com/vx5r.html

In fact, I would LOVE such an option on the follow-on TH-D7A, which I hope and pray will soon be available with the same altitude-enabled firmware that the D700A has.

In the Rochester MN area, we have 7 of them (over half of them in operation
so far) Look for N0EST-9, AA0SM-9, W0SHL-8, N0HZN-15, others soon

I am planning on using APRS to track a Radio control model.
Any recommendations for a very light transceiver?

I am currently planning on using an Alinco DJ-C1T "Credit card" transceiver.

If the position reporting is commanded over the normal 50Mhz RC control
channel,
a receiver in the aircraft might not be necessary.

Anyone know of plans for a small xtal controlled FM tx?

Paul (Kl7JG)

Sounds neat, but what is the range of the model? I would expect that
the range would be less than the amount of wander from SA making the
location you get back not too usefull.

I am interested in several FAI record attempts.
For instance: The record altitude for a piston powered Radio Control aircraft
was set by the Russians at around 28,000 ft.

The declared distance record is around 800miles.
During these kind of attempts it is easy to "lose" the aircraft momentarily,
and a (D)GPS position can be very helpful in the un-lose stage.

These are not the specific record(s) I am after, but they illustrates the
point.

Agrello used to have something called the MicroPLL. It is often used for
foxhunting, but I use one with a TNC for remote weather. It is a frequency
agile TX only and can be programmed to transmit MCW or onboard audio at
timed intervals. With a MIM or PIC it could parse info from a GPS.

I also use and own a Paccom PicoPacket with a built in Trimble GPS receiver.
That PICO with a MicroPLL would make a nice small tracker. I have
entertained selling these items, if you are interested email me off the sig.
(I bought a D700 for the car, making a nicer, but bigger, mobile APRS
station.)

If you have corresponded with me via **direct Email** over the last few months, and have any important items you consider still "open" or active that I need to reply to you on, could you please **re-send** any of those messages to me (if they are still in your sent items folder). If you do have some recent sent messages to me out there regardless of being "completed" or not, it still would be helpful for you to send them so I can fill the holes back in, because...

It appears that being way too tired while working on the computer late at night has come back to bite me. Somehow I accidently deleted the folders I had set up in Outlook Express for all APRS and THD7/TMD700 related messages. Of course, I had the "empty deleted items folder upon exit" checked so when I shut down early this morning, I flushed it all.

I can recover sig messages by fetching the archives from TAPR, but personal messages are (maddeningly) *gone*. Yes, I have a older backup, just doesn't cover the last two months or so. Time to revisit/rewrite my backup scripts @#@$#!

Thanks for your trouble...

284. [htaprs] TM-D700

From: "Thom Proehl" <tmproehl@nwlink.com>
Date: Sun, 23 Jan 2000 11:49:46 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-62232-2000.01.23-13.46.32--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been experiencing a rather odd behavior in the D700 that I can not diagnose. When the TNC is in APRS mode and left in P.MON for what appears to be on the average of 30 minutes the screen quits displaying packet data and after 2 or 3 minutes shuts the radio down. I can watch the data stream on another radio-tnc-computer setup sitting next to it and it does not appear to have anything to do with the data. Anyone else experienced this? If so what is the apparent cause?
No, I do not have APO enabled, I thought of that first!

I have another question for the guru's out there, I see APRS beacons/position reports reflected back from a local RELAY to another system as this:
K7FZO-7>T7RWYP,RELAY*,WIDE3-2: '1Ddl j/]
K7FZO-7>T7RWYP,RELAY*,WIDE3-1: '1Ddl j/]
I'm not sure where the T7RWYP comes from and what the '1Ddl j/] means. Could someone help clue me in?
What is seen on yet another system is this:

K7FZO-7>APRS,RELAY*WIDE3-2:@154207h4727.90N/12140.72Wj000/000MIC/M2/In Service..]
K7FZO-7>APRS,RELAY*WIDE3-1:@154207h4727.90N/12140.72Wj000/000MIC/M2/In Service..]

**ignore the hyperlink (underline) reference, the @ sign creates that

behavior.

In my opinion with only 1 week of on-the-bench testing, this is a very cool
rig! The software is a great addition, I have several alternate files
created for different locations and modes.
Way to go Kenwood!

Has anyone used the ARRL program, TravelPlus for Repeaters, with APRS?
Such as having heard stations plot on the map? If you attach a GPS directly
it will show your current position.

73,

I have gotten lockups watching 9600 baud satellite downlink data. After
only a few minutes, say 5 or 10. But most of the packet data is pure
binary gyberish, so I just figured it was the data....?

*** Thats a Mic-E posit.

> What is seen on yet another system is this:
> K7FZO-7>APRS,RELAY*WIDE3-2:@154207h4727.90N/12140.72Wj000/000MIC/M2/In

That is an "expanded" Mic-E packet. Probably by a "smart" digi... or some
other author's intermediate software... I could not get the
other authors to agree to a common format, which would identify the source
of the expansion, so good luck... Also, It contains TIME, but no date...

Is this offer an effort by Kenwood to clear out the channel to make room for
the follow-on D7 with integrated GPS and WX sensors? ;-)

I am trying to get the TM-D700 to display the recieved stations in WinAPRS. I have been able to use the Kenbwood computer program to program the radio so I think my cable connection is working ok. What settings do I need to get the 700 tnc to talk to WinAPRS?

Bill,

re:
>There are a couple of die-hard packet users who are probably hostile to APRS.
>I'd like to be prepared to argue FOR APRS, not against traditional packet.

Traditional packet IS the best for transporting large amounts of data
from one point to another...BUT...

APRS IS the best for coordinating a large group of people (ie incident
command) where many people can be reached with one transmission and
everyone can monitor what is going on.

Each has it's place.

Kind of like cell phones vs amateur radio.

In one of our bikeathons, our sag wagons have both. Cell phones are
great for high volume point to point traffic, but the drivers LOVE the
amateur presence because they can keep up with the situation across the
entire course. They felt isolated without the Hams. Each has it's
place.

Why would a die-hard packet user be against APRS? Oh, I see.....it's the
old "Well that's the way we've always done it here before..." syndrome.

They are probably the same people who think that actually using a packet
frequency is called QRMing. After all, their MACHINES must talk to each
other. A living, breathing human being must never, ever key up on a packet
frequency and try to talk to someone else. That's QRM since it interferes
with their precious machines. And the absolute WORST kind of QRM anyone can
produce are <UI> packets.

Truth be told, we need BOTH kinds of packet operations: Traditional BBS and
APRS. We also need a third kind called DX-Clusters. What is really too bad
is that we can't use the same frequency for all of them. But then one WOULD
have QRM issues! :-)

I would never aruge AGAINST traditional packet. I would argue for BOTH.

Just wondering what experiences people have had with using their D7 on 9600
 baud packet or with the PACSAT's? I am wanting to experiment with some
 different stuff here in the Portland, OR area besides APRS and 1200 baud
 packet.

It works great as a downlink monitor. Tune in to UO22 and you should be
able to receive the downlink with a small handheld UHF beam. But you
cannot uplink, because the TNC is not wired for crossband operation.
The D700, however, is.

We are hoping that some of the newer 9600 Baud PACSATS will eventually
enable digipeating for us. SO-35 and ASUSAT both have 9600 baud capabilty
that is uncommitted so far... and believe me, I have been asking them to
consider digipeat mode.   Then with the D700, at least, we could have
mobile APRS satellite communications...

If anyone has the D700 and is knowledgable about satellite operations,
lemme know...

Regarding the question about what can you hear with your 9600 baud THD7,
or D700 here is better answer:

UO22, KO23, KO25, TO31, and SO35(not yet activated)

and tonight's possible launch which may include:

---------- Forwarded message ----------
> > From: Rick Gilligan <rick@case.net>
> >
> > The next attempt at launching JAWSAT will be ... Wednesday evening
> > at 19:03 PST with a three hour extended launch window.

There should be a least 4 new 9k6 beacons from this launch.

Jawsat   437.070 and 437.175
Opal   437.100
ASUSAT   436.700? mhz

Please send any packets logged from Jawsat to n7sfi@amsat.org

During the 30 sec beacon 2 packets are sent. One at the start and another
just before it turns off. The time between packets can be used to tune in for
the last packet. The time between beacons if I remember right is 255 seconds
for one and 60 seconds on the other frequency.

Jon Ogden wrote:

>Why would a die-hard packet user be against APRS? Oh, I see.....it's the
>old "Well that's the way we've always done it here before..." syndrome.

Right-o. Rather than treating communication as a means to an end, a
tool even, many traditionalists see it as the end, in itself. This
subtle difference in philosophy leads to stagnation and the rejection of
new communication "tools", like APRS and the Internet. And it isn't
limited to the traditional packet bunch. Even the beloved TH-D7A comes
under fire: "Cute toy, but see-double-you is how we pass traffic".

Don't believe me? Just search AltaVista for the term "Amateur
Telephone" and get our your fire suit. APRS is considered by many to be
the very embodiment of evil, and a consort with the enemy: the accursed
Internet, for which vitriol and Perdition is reserved. To wit:
http://home.texoma.net/~n5pvl/amtel.htm.

Now, this the APRS Hot Technology SIG, where we talk about leading edge
stuff in APRS. Which takes me to Jon's point: There are people who are
turned off by anything that is off the beaten ham path. APRS, by its
nature, tends to assimilate non-traditional techniques and technologies,
which makes it tabu for many closed-minded people.

How to counter this? It's tough, because you're going against a
philosophy that's pretty ingrained. You might try to speak of "nodes"
and "backbones" and other things familar to the traditional packet
crowd, and try to make APRS seem not so far off the beaten path. (And
don't mention the Internet!)

However, nearly all of the things which make APRS repugnant to
traditionalists enhance its ability to make it through when the going
gets tough. With APRS, if you can't get traffic through the terrestial
VHF path, there's Internet, satellites, HF, wireline, etc.

Now, please don't get any ideas that I think like this; many of you know
me, and know I embrace APRS fully. Sorry for the ramblings, but this
one's kind of close to me, as I know people personally who are like
this.

73 & Good Hunting,

Steve

Hello

Well I have the second straight D7A that has blown
its output on two meters. What's the deal with these?
My antenna has flat SWR, I have heard that this
is occurring. Has this been addressed as of yet?

I use mine while at work every day so it gets a
workout. Is it possible that the rig can't hold up to a
heavy duty cycle. I have an empty alkaline pack on the unit, with a
cigarette lighter powering the unit to full power. Again the antenna is
fine. Both have lasted about 3 weeks or a month.

Any ideas? Actually this is my third. First one wouldn't receive
data from the GPS.

When I smoked the GPS connection on a D700A, Kenwood Tech Support
said that it is important to power down the radio and GPS prior to
connecting the cables. That's how they suspect I smoked the GPS
connection. They also said the you should shouldn't attempt a hot
connection on a D7A either.

Steven,

 Yes, this sounds like a ground return problem between the radio and the
GPS. The GPS connector being a mini phone jack could have mixed the data and
ground as you plugged in. If you are running the GPS on internal battery you
might get away with it. Good grounding is always important but hard to do in
a mobile or portable environment.

Hi, all -

Well, I'm new to the SIG and to APRS, and I don't think of myself as a
traditionalist or closed-minded, nor do I believe that is how I'm
perceived by my local peers, many of which are avid APRS'ers. However,
I'm still waiting for APRS to prove itself (to me) as a really
valuable technology.

Yes, I take a decidedly emergency comms view of a lot of things, trying
to figure out how I can use a particular tool toward that end. And I
fully acknowledge there are some great benefits of APRS tracker
capability during disaster response. But it is not the only digital
application or even the primary one I would consider valuable in

emergency comms, because it is not really a "communications"
application.

Perhaps what torqs "packet traditionalists" is the notion that APRS is
being billed as packet's successor, which it is not, and cannot be. APRS
as I see it, is a telemetry technology. It's great for unattended,
non-interactive applications of the "Just letting you know what's
happening here" variety. It works OK for passing short text messages,
but it is not viable as a point-to-point transport medium. For me, it is
not the sort of thing that engages you like a good news story, but is
more background data, like stock quotes. When you need some data in
particular, you go get it.

"Trafitional" packet was designed for an entirely different application
-- to move data across a network of packet nodes. To be fair, packet is
another "utility" application of radio, and admittedly, is no more
engaging than APRS after its novelty fades. Once dial-up access to the
Internet became widely available, packet's benefits were quickly
eclipsed by wireline access, and with its inherent bandwidth
limitations, it's doubtful packet will ever again achieve the popularity
it once enjoyed.

However, there are a couple things I believe can revive packet's
viability to some extent. One is to embrace TCP/IP, which would allow a
packet network to serve as a wireless extension of the Internet. Since
the Internet is ubiquitous among hams and non-hams alike, this could
promote the use of packet among hams, and allow its use to reach and be
reached by non-hams as well. And by emulating a technology which has
unquestionably established itself as a dominent force in society, packet
could continue to play a role in global message and data transport.

Secondly, I believe that any application that mimics or provides access
to an entrenched publicly-accepted technology such as the Internet or
public telephone network is inherently more valuable than one which has
a closed group of users and limited access or interest to the rest of
the population. Which may explain why APRS is still kind of an orphan.
To make APRS really viable, you have to gain the interest of the non-ham
population as well. If the novelty of APRS is appreciated primarily by
hams, I submit that it is not really APRS that is so wonderful
in-and-of-itself, but merely that it is another application of radio
that has its followers so enamored.

And maybe it's just me, but squirreling around with a laptop in the car,
which is the only real way you can benefit yourself from APRS
technology, is clunky, costly, and to some extent, just plain dangerous
while the vehicle is in motion. Even early reports from new D700 owners
don't sound particularly promising that we can eliminate the laptop
component. With limited display and user input (i.e. keyboard)
capability, a GPS and D700 by themselves don't sound like the answer.
And you still haven't answered my first question -- What inherent human
benefit does it (APRS) provide, anyway?

APRS seems most valuable as a fleet management tool. Where someone in a
central location can display the location of various in-motion vehicles
and personnel. I can see the value of this in emergency communications,
but it would never be a prioirty as far as establishing communications
capabilities in adverse conditions. And this underscores my initial
assertion -- APRS is not engaging, it's just kinda there. What makes it
engaging for a while, is the marriage of such strange bedfellows.

On the other hand, voice mode has inherent personal communications
value, and appeals to non-hams for what it provides, not how it works. I
believe packet has the same inherent value, in that it can transport
your message or data when you have something to send. You need not be
impressed by how it works to appreciate what it can do.

APRS in action is more like broadcasting the time of day, and you listen
only for a moment when you need to know what time it is. Yet the
broadcast is incessant, whether anyone is listening or not.

Finally, let me suggest viewing APRS in a different way. The explosion
of Internet access popularity is the result of a fundemental need by
society that was not being met previously (no, not the porn sites).
While e-mail alone is a HUGE draw for Internet access, I seriously doubt
whether most Internet subscribers would pay a monthly fee to see where
their family or friends are at any given moment or what the weather was
at their friend's house, even if they didn't have to make a substantial
investment in APRS hardware.

Just one man's opinion. I'm sure the flames are already on their way...

307. [htaprs] Rubber Duck "Experiment"

From: Ralph Milnes <milnes@openix.com>
Date: Wed, 26 Jan 2000 12:46:27 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-62685-2000.01.26-11.44.51--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Using an MFJ SWR Analyzer (MFJ-259B 1.8 to 170 MHz), I've been playing
with the 3 rubber ducks I have for my Kenwood TH-D7 dual band.

I won't pretend I'm an engineer and say the results below are accurate.
They aren't. But my imperfect results show:

A. On the stock Kenwood Dual Band rubber duck, a resonant frequency of
~159.0 MHz with a minimum SWR of ~1.0 to 1

B. With a Premier 17" dual band thin antenna (RD-98 SMA), a resonant
frequency of ~153.2 MHz with a minimum SWR of ~1.1 to 1

C. With a Premier 7" dual band thin antenna (RD-9 SMA), a resonant
frequency of ~146.0 MHz with a minimum SWR of ~1.0 to 1

There's a good chance I'm not conducting my experiments very
scientifically. Trying to take measurements was like trying to nail Jello
--- placement of the antenna, feedline, analyzer and *me* was a dance. So,
I know you won't be able to replicate my results -- heck, if I sneezed or
moved the feed line I couldn't replicate them. But the relative results
seemed to be about the same:

* I never could get the Kenwood to tune in the 2M ham band
* The small Premier seemed to do the best, in or near the ham band
* The tall Premier seemed to come out in the middle, but never quite in the
ham band.

Anyone else ever done any rubber duck testing similar to this? Comments or
advice?

Still learning,

Ralph, KC2RLM

Dwight L Hazen wrote:
> After that I never would buy a Kenwood again until the D7 and D700
> came out on the market.

Yikes -- I just agreed to buy a friend's D7 because he lost interest in
it after about a month. I have had constant problems with my TM-V7's
display (don't even get me going on that topic...). I just found out
that the D7's TNC is flakey in KISS mode, so I can't use it for TCP/IP
packet as I had really intended.

And now Kenwood has the nerve to start giving away the PG-4W package if
you buy a new D7! What about all of the earlier D7 buyers who supported

Kenwood while they rolled out their new product (and then promptly had
to recall them all to update the firmware).

I'm not a happy camper in the Kenwood park.

I did. Wow. What a diatribe. But his point is good in that we must
remain ever vigilant not to "depend" on the internet (locally)..
Fortunately, I think the marriage of "local" APRS to the internet is
mindful of the pitfalls and does continue to strive for RF first at the
local level (what APRS was designed to do), and links to the Internet to
"augment" it for the 99% of the time we are just having fun!

 Ed,

 I think you will enjoy the D7 no matter what! I have yet to send mine back
to Kenwood for firmware upgrade because I can not bear to have it out of my
hands for more that one hour. Its on all night long on my bed side table
faithfully displaying my home weather station data. I have run kiss using
Jnos and it seemed to work ok, but I did not have it hooked up for long so
problems may exists. I have used the DX cluster display and enjoy that. Is
the D7 perfect? no, but for the price its a good deal. I cant wait to see
what the next radio will do and from what vendor the super radio will come
from!

Dwight -

> I have run kiss using Jnos and it seemed to work ok, but I did not
> have it hooked up for long so problems may exists.

With the DOS version of JNOS, I can't seem to get the radio to send
data. The radio transmitter keys and you hear the initial tone, then it
turns back off. JNOS just keeps trying over and over, but the
transmitter never stays keyed long enough to send out a packet.

I have a hunch it may have to do with the fact that the D7 doesn't
supply a high DCD, DSR, or CTS line to the PC serial port. I can't find
where in the JNOS config that checking these lines might be enabled or
disabled. I could just loop outputs to inputs at the connector, but I'd
like to know what the real problem is first.

If you have any ideas, I would appreciate hearing them.

I don't really have anything against Kenwood, but I'm getting seveal
examples where quality assurance just seems to fall through the cracks.
The TM-V7 display has two strikes against it -- aside from the general
visibility complaints in bright daylight, the display drivers are
terribly heat sensitive, and sitting in a hot car, it's not unusual to
see several solid vertical lines in the display.

It seems the D7 is plagued with the same sloppy design -- finals that
blow prematurely, and firmware bugs that aren't disastrous, just a pain.

Thanks for the vote of confidence though. Other than the display, I love
the V7.

On another topic, the B side of the D7 will not tune outside of 144-148
when switched to VHF. (I'm not talking about Tx, I can't even select a
memory preset for the local weather service broadcast.)

Does anyone know of a software mod for this? If not, will the MARS mod
(clipping green wire) or the wide-open mod (removing diode chips) fix
it?

Many thanks,

73

  OH ... Charles is rather infamous in the connected packet world for his
diatribes ... I would however point out that while he often has some good
points to make they get garbled as they try to get around the foam exuding
from his mouth ... one more point ... despite his firm stance about "No
Landline Lids!" It is via that same Internet Landline that he is getting his
point out! sigh!

I think I started this one. A couple of weeks ago I announced plans to conduct
an APRS forum at the Jackson, MS Hamfest on Feb. 4-5 and asked for help. A
concern of mine was the possibility of getting into a debate ... and I don't
know enough about packet to know what I would be arguing about. My desire was
to make the case FOR APRS without putting down "traditional packet". I have
seen some very good points for each.

Anyway, in the meantime I have connected to the local bulletin board and gone
keyboard to keyboard with the sysop, one of the fellows I was concerned about.
He may be on this SIG, for all I know. I made sure he was aware of the Forum,
asked him to be sure to be present because of his expertise to help me field
questions, etc. I hope I have recruited an ally. I think he has the time - and
I know he has the experience - to become a huge asset to the APRS "movement".

Bob, Ed, Jon, Steve, John - it is helpful to me to be able to point out where
each application excels. Thanks for that. I'm all for my friend rejuvenating
interest in packet. APRS will get some spill over from that. I got into APRS
first - now I know how to connect to a BBS with Hyperterminal!

I'm still accepting suggestions for the forum. The idea is to define what it
is, for the benefit of those who don't know anything, and then facilitate a
discussion of what we, in Mississippi and the surrounding states, can do to
build on what we have. I can assure all of you that I will report the event
here as well as at http://www.jxnarc.org as soon as I can.

By the way , you are ALL invited to our Hamfest.

I'm in the process of putting a small APRS tracker in a large RC sailplane.

I need to purchase the parts for the other end of the link.
I'm thinking about the DH7A

Can I set the DH7A to only display APRS data from one source?

If it is displaying the data from that source will it also display
range/bearing (Assuming it is also hooked up to a GPS)?

If I want to include telemetry from the plane.... will the DH7A display that?

Rendered body type: text/plain

I have several questions about using APRS in a different way.

I'm in the process of putting a small APRS tracker in a large RC sailplane.

I've heard of people using the MicroPLL modules to send APRS data, how does the
unit know when it is clear to transmit?

How does APRS avoid collisions?

If I am using a transmitter transmitting in the blind, (Like the microPLL)
how often can I send a single UI telemetry frame and not abuse the APRS system?

If I am using a full up transceiver in the plane and only transmit when the
channel is clear how often can I send telemetry and not abuse the system?

If one wanted to send rapid telemetry, every 5 secs , for an hour what band
would anyone suggest so as to not be annoying?

Thanks for your input

Paul (Kl7JG)

That is correct. On the B band the TH-D7A will ONLY tune in the 2M ham band. It does NOT have extended coverage there.

If you want extended VHF coverage plus APRS, then you can put APRS in the B band and do your VHF stuff in the A band.

I bought my TH-D7A at Dayton last year. It went into my car and ran as my
tracker. I used it continually bleeping packets every two minutes all day
long and sometimes all night long when I forgot to turn it off. Other than
the problem of the APRS software in it sometime mysteriously locking up, it
has never had a problem.

The only reason I stopped using it as my tracker is that I bought the
TM-D700A and now use it.

Believe me, I used it a LOT. It was also my 2M voice radio at the same time
as it was the APRS tracker.

I believe the radio is of a good design and is a very good quality rig. I
am sorry that you got a couple of bad ones. Are you in an environment of
potentially high static discharge or other possible strong sources of
possible EMI?? Maybe that is damaging it? Or perhaps your voltage source
supplying power to the rig has ripples or peaks above the radios maximum
voltage spec?

AES has them for $679.

I think some outfit in Nevada has them for $649 or something? I think that
was the cheapest. Check out the archives of the ht-aprs list. There was
plenty discussion about a month ago when the radio first came out and who
has it at what price.

Ralph,

How about providing some details about your "experiments". Making valid
antenna tests is very difficult. As a former antenna engineer, I have
experienced very strange results in my own experiments.

For example, did you use a half wave length or multiple of a half wave
length of feedline to the duck(s)? Ducks are "designed" to work against
the body of the handheld and I would suppose the human attached to it as
well. I hope you see the point I am making.

Just for interest, try your ducks on a sheet of metal that is several
wavelenghts in size. When I made professional antenna measurements for
antennas such as ducks I had access to a 10 wavelength ground plane (sheet
of metal).

Interesting information though.

Greetings All,

Not a flame, just my perspective.

My primary interest is Emergency communications/Public Service as well. I wouldn't still be in amateur radio if all there was to do was paper chasing and rag chewing. As some one who works in the computer industry, I was never interested in packet because it was too bloody much like I did for a living. I used ham radio to get away from computers. I never even considered getting a TNC until I found out about APRS.

For me, this was the first interesting use of a TNC that I had found.
>From this, I've started moving into helping get packet comms integrated into our local emergency operations, in addition to integrating APRS.

During the last SET, I was able to put out APRS bulletins letting folks know what nets were active and status of the SET. We also tried point to point comms and finally got -one- link established. (since then we've gotten a wide area packet digipeater into operation).

One last point, I've had several non-ham friends look at APRS and think that it was "neat". They would have looked at packet and said "so what?" I hoping to use this to get one or two of them interested in getting a license.

Bottom line, "traditional" packet, and APRS are complementary and when combined can have a synergistic effect on daily and emergency operations. It's not either-or.

The problem with measuring the impedance of a rubber duck is that it is really designed to be on a ground plane. When on the radio, the radio is

the ground plane (along with your body!). You mentioned you had feedline.
Adding a piece of feedline in there will affect the results. The most
accurate way to do it would be to get an SMA to PL-259 adapter and put the
bugger right on the analyzer. You will also need to stand clear of it when
reading the results as the fact of your body being next to the duck will
affect it's impedance. In the same way when you were measuring it before,
if you had the duck lying on your table, that will affect things as well.
For optimum measurements, the duck really needs to be extended into free
space.

And in reality, rubber ducks usually have HORRIBLE impedance matches.

 I bought mine in the early March and it has been used (and abused) in
exactly the same fashion and it still perks along like a champ. I have to
believe something else is at work here.

Bought a D7A today - great little rig and appears to
be working fine in APRS mode (no GPS).

BUT... I don't show up on the www.aprs.net:8000/[callsign]
internet site.

I'm guessing that by choosing the internal position setting
option as opposed to using a GPS, that the string sent
out by the D7A isn't compatible with the list of strings
on the internet server display site.

Am I right or anybody got any ideas to try?

By the way, I usually use [callsign]-9 with my other
tracker but am using ve3rhk-9 plus the car symbol on
the D7A - perhaps what I'm transmitting is actually
ve3rhk-9-9????

Hi Adrian,

I just checked the MAP.APRS.NET/VE3RHK-9 URL and you showed up!

The report was received 33 minutes, 32 seconds ago. You are on Alta Drive
between Vandallia and Deauville Streets in what appears to be Las Vegas.

Looks like your new toy is working FB.

No you aren't transmitting your -9 twice.

Rendered body type: text/plain

I saw my output drop off on my d7a, and while investigating the source, I put an sma to bnc adapter on to connect to test equipment.

What I discovered was if the sma connector was tight, no rf out(low.. very low), and as I loosened it the power jumped up to rated power. On further investigation I found the center pin of the antenna JACK (socket) was expanded out enough that when I tightened (straightened) the sma, it would break contact. I never connected anything large pinned to the center pin, so I suspected it was expanded when I bought it and since. As a radio tech commercially I decided to dissect and see what was up. After dis-assembling this radio (sorry Kenwood).. I found that the center pin (female) was clearly oversized for proper mating to antenna male. AFTER REMOVING assembly and removing center pin from assembly, I squished the center pin CAREFULLY back together and re-assembled the radio further testing indicates that was all the problem was.

Clearly the pin was physically distorted when you look at the pin itself.BUT we are talking MILS here... very tight tolerances...

Maybe part of the testing caused this, maybe even I caused this, as I was using another antenna, and had connected SMA adapters before.. but this was the root of my problem..

I have heard lots of complaints of 2m deafness and poor TX with the factory antenna. Most blame is the antenna. Mine was deaf also and poor TX too. I used an mfj whip since last march. BUT when I use the factory antenna since I fixed that JACK on the radio all is as it should be. I am only using the factory whip.

A quick test to verify if the antenna socket is the culprit is to set 2m rx to something strong like NOAA weather or such and see if loosening and wiggling the sma connection causes make break (on the s meter or audibly). At one thread turn it should not.

WIGGLE gently, do not make a problem where there is not one. TX always manifests itself FIRST as the dropout was like 40db.. but the S meter will show if you do have a problem RXing with the connection.. Tightening it to firmly seated definitely caused mine to cut out...

This is just a test, I do not nor would KENWOOD, condone you opening your radio and servicing it even if you are Qualified.. If you kill yours you will probably void your warranty, I am just impatient enough to take a look first, then get it serviced if I cannot find the trouble..

You are hereby forewarned..... :-) Doug Bade KB8GVQ

This is why I reallly dislike the current trend in radios to go with SMA connectors. The SMA connector is NOT designed for the abuse that a handheld experiences. It was designed to be connected ONCE and left in place. I can very easily see that if you had a big SMA to BNC adapter connected to your radio and an RG-58 cable coming off of that, you are putting a HUGE strain on your SMA on your radio (I don't know what you had, but....)....

NEVER, ever have a big connector hanging off your SMA on the radio. The lateral strain could quite easily cause the center pin to distort. The SMA is a very delicate connector.

When I first got my D7A I went to a hardware store and found a "O" ring just the right size to fit on the SMA connector, it fits into the radio case around the connector and acts a cushion and seal to keep the antenna tight.

I just looked at the inside of the connector as I am sure many of you just have.. and I see small chips of metal on the insulating part of the connector! The center connector looks ok by the eyeball test. Got to clean out the connector, I figure the metal comes from the threads. SMA might not be the best connector for HT's. Can you say BNC? But I have worn them out on HT's also.

AMEN!

I've used both SMA<->PL259 and SMA<->BNC<->PL-259 setups, and have noticed when I tighten the connectors down that I lose Rx. I didn't even try to Tx, figuring that I would screw up the finals. I have *three* D7s and they all exhibit this behavior.

Don't misunderstand me, this is an excellent radio, with the exception of the choice of antenna connector. Maybe if Kenwood hears enough negative feedback about SMA, they'll reconsider and go back to BNC for The Next Big Thing in Handhelds. I'd have gladly paid an extra $5-$10 (!) to get a BNC connector on the D7.

(I wonder if this is a conspiracy with the antenna manufacturers? You know like why there's eight hot dog buns in a back, but ten hot dogs in a pack! <bg> ;-)

Yeah, I know, I'm whining. I'll stop now. :-)

Actually no I never did but a clearly agree with your comments. Of all the antenna connectors for portables and mobiles.. I prefer the tnc as even the bnc gets loose due to mechanical stress... but the tnc holds tight.. HOWEVER.. the stress now moves to the radio and usually breaks the case etc... (Icom U16) etc..... Kind of a no win situation on plastic radio's ..

A male pin connector on the radio, with a female socket pin on the antenna
may be a solution in the long run as the wear would then move to the
disposable part (the antenna)....E(GE) actually uses molded plastic
antenna's on the public safety stuff.. this mount uses a lateral spring
loaded friction connection to the center pin.. Survivability is excellent.
Radio Case is metal, with threads for antenna. when the antenna breaks off
(as they do).. just chase the threads after removing stub and off you go...
the center pin never takes internal damage... Big problem is you need a
40.00 adapter to hook up external antenna or test equipment !!!!! oh well
another trade-off. ...

In this case I can say I did not cause said problem with anything
oversized, but suspect in the manufacturing process or testing may have
been amuck..... It sounds like this may be adding to some other peoples
troubles.... just a guess.....

Rendered body type: text/plain

Hi All,
     Well here is what I did on my lunch hour. I got to use
the "new" HP 8752C network analyzer on an assortment of HT
antennas

Kenwood TH-D7A antenna

max resonance at 160 MHz return loss = 9.5 DB SWR= 2.0
144   2 DB SWR 8.7
145   2.3 DB SWR 7.8
146 2.5 DB SWR 7.0
147 2.7 DB SWR 6.5
148 3.0 DB SWR 5.8

max resonance at 312 MHZ return loss = 7.5 DB SWR = 2.5
420 2 DB SWR 8.7
430 2 DB SWR 8.7
440 2 DB SWR 8.7
450 2 DB SWR 8.7

COMET SMA 503 DUAL BAND ANTENNA

max resonance at 151 MHz return loss = 4.2 DB SWR = 4.2
144 3.2 DB SWR 5.6
145 3.5 DB SWR 5.0
146 3.5 DB SWR 5.0
147 3.6 DB SWR 5.6
148 3.7 DB SWR 4.8

max resonance at 460 MHz return loss = 20 DB SWR = 1.22
420 6 DB SWR 3.1
430 7 DB SWR 2.6
440 9.2 DB SWR 2.05
450 12.5 DB SWR 1.62

ICOM FA-S270B SMA TRI-BAND ANTENNA FROM T8-A

max resonance at 146.3 MHz return loss = 18 DB SWR=1.288
144 6 DB SWR 3.1
145 9 DB SWR 2.1
146 17 DB SWR 1.329
147 12 DB SWR 1.67
148 6 DB SWR 3.1

max resonance at 380 MHZ return loss = 13.8 SWR=1.5
420 5.2 DB SWR = 3.4
430 5.2 DB SWR = 3.4
440 5 DB SWR = 3.57
450 4 DB SWR = 4.4

max resonance at 52 MHz return loss = 35 DB SWR = 1.036
10 DB (SWR=1.92) at 51.9 MHz and 52.3 MHz
5 DB (SWR=3.57) at 51.6 MHz and 52.5 MHz

ICOM FA-1443B BNC ANTENNA for 24-AT

max res at 141.5 MHz return loss = 13.5 DB SWR=1.54
144 9 DB SWR=2.1
145 7 DB SWR= 1.53
146 5.5 DB SWR= 3.3
147 4 DB SWR= 4.4
148 3.2 DB SWR=5.55

max resonance at 360 MHz return loss= 10 DB SWR = 1.9
420 3.8 DB SWR=4.6

430 3.8 DB SWR= 4.6
440 3.2 DB SWR= 5.55
450 3.0 DB SWR= 5.85

All tests were done using a set of unidapters to connect the antenna
to the "N" connector on the instrument. The unit was placed on a
wood table at least 3 feet from any conductive surface. Readings
were affected less than 1 DB by hand motion nearer than 2 feet.
I was out of that circle when recording the readings.
     As a aside, I measured the Kenwood antenna at home
last night with an MFJ analyzer and got a center freq of 161 MHz
with an SWR of 1:1. That has been my previous experience,
that the freq of resonance is good, but the SWR tends to be
higher than the MFJ reports. Also, the MFJ said the best SWR
in the ham band was at 148 with an SWR of 1:3.
     Hope this helps,
     Jim Korenz   N8PXW

Ralph,

The TH-D7 is a dual band rig. Did you take any measurements for
the 440 band?

Gary

> Thing in Handhelds. I'd have gladly paid an extra $5-$10 (!) to get a BNC
> connector on the D7.

Actually, don't tighten the SMA's too much. SMAs are ALSO designed to be
properly fitted to their mating connector with a torque wrench. Too much
tightening is as bad or worse as not enough. In the absense of a torque
wrench, just make it snug. No need for it to be TIGHT.

As for BNC connectors, they are FAR cheaper than SMAs. So you wouldn't pay
more. Why are SMAs used? A little smaller and it's a marketing gimmic.

I doubt they'll take it away and go back to BNCs. All of the new handhelds
are coming out with SMAs from all the manuf.

Actually the center pins of most SMA connectors are gold plated. The gold
is what flakes off that you can see. It is an abrasive fit between the
center pin and the center jack.

340. [htaprs] APRStk Tracking program

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 27 Jan 2000 18:00:52 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: aprsnews@tapr.org, htaprs@tapr.org
Message-ID: <LYR845-62925-2000.01.27-16.58.38--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With 4 new HAM satellites launched last night, and "potential" for mobile
satellite communications using the new Kenwood 1200/9600 baud DATA radio,
I added satllite tracking to APRS so you can not only see all your buddies
on the map, but the satellites as well..(they're everywhere).

APRStk has these new commands for satellite displays:

```
OPS-SATS        Draws a time line showing the next 2.5 hrs of passes
OPS-PREDICT     Goes faster than real time to see satllite movement
INPUT-KEPS      Allows you to update your KEPS from a text file (Y2K-OK)
INPUT-TIME      Moves forward in TIME for another 2.5 hour view
LIST-KEPS       Lets you see what satellite KEPS are loaded
LIST-FREQS      Shows a table of operating frequencies for all birds
F1-HELP         Gives a help file
alt-S-REDRAW    On faster machines, will update the OPS-SATS time line
                with every map re-draw
```

APRStk also uses the new APRS compressed format so that positions take
only 13 bytes for complete LAT/LONG/CSE/SPD to the nearest foot anywhere
on the globe. Thus a complete 1200 baud POSITION/STATUS report takes
less than 0.3 seconds.

APRStk can also uplink the moving satellites as objects on the air so
others in your area can see the satelites on their APRS maps too.

Download APRStk from ftp://tapr.org/aprssig/dosstuff/APRSdos/aprstk.zip

This is a 200k EXE and satellite files only. It must be loaded into an
existing APRS directory with the other 1meg of map support, etc...
If you need a full install, then get the file aprs846.zip from the same
site. In BOTH cases, install them with PKUNZIP -D into your APRS
directory (or use WinZIP) to get the proper directory structure...

Enjoy.

de WB4APR, Bob

To see the ASTARS concept http://web.usna.navy.mil/~bruninga/astars.html

P.S. If you are new to APRS, you must do the following as a minimum for
satellites to be in the right place:

1) Put yourself on the map with the INPUT-MY-POSIT command
2) Set the correct Time Zone during start up or using alt-S-OTHER-ZONE
3) Have correct PC time
4) Zoom the map to any scale using the PG-UP/DN keys

I'm the proud new owner of a DH7A.

1)The unit came with a 2.5mm rt angle plug to un-terminated wires for
hooking up to a GPS.
Where can I buy more of these cheaply?

2)How do I protect the SMA connector with external antenna cables, bouncing
around in the car.
Does anyone make a short SMA to PL-259 jumper?
I'd rather not screw the big adaptor directly to the unit.
The Ideal adaptor would be a Rt angle SMA 6 inches of flexible coax and a
female PL-259.
The next best thing would be a RT-angle SMA to 6 inches of flexible coax to
any kind of connector.

3)So far I've been monitoring 144.390 with the TNC mode turned on, I
received one packet....
but I'd not yet figured out that TNC mode needed to be turned on.
So I missed it, after I turned TNC mode on I never heard another
packet...in 40 minutes of listening.
(I had to stop playing and go back to work ;-(   )

At Near 42.8982N
          71.0683W

As to the question of seals. I have found that Panasonic phones that have
the SMA connector have a boot that comes down to cover the connection of the
radio and fits in the grove of the radio as well. I don't have the part
number right off my head but I can get one.
    I will let everyone know if they are interested.

Oh, and I use a SMA-3 from Comet if anyone is interested for the TH-D7A.

OMG!!!!!

I looked in the SMA connector on my d7 and I almost fainted!. Any
D7 owners you had better look NOW and clean the connector right away. I
found gold 'flakes" and ----- worse ---parts of thread metal (curved lengths
of metal like threads shavings!) right on the teflon insulator! I dont
know why mine has not shorted the finals. I am now more than ever convinced
that Kenwood needs to change the connector on future units. I will not be
taking my antenna on and off from now on. (I was using a adapter in the
auto) I am still looking for a better antenna than the stock one.....

Doug, here is a copy of a post I made last year when the
D7A first came out. Since then I've found that if I use the aftermarket
Comet SMA24, its center pin will spread the fingers on the D7A SMA
connector far enough part that the stock antenna will not connect
if it is tightened down (as you've discovered). I "retired" the
stock antenna and use the RD9 or the SMA24.

My Th-D7A experienced this same behavior after I
over tightened the stock
antenna onto the radio. The problem showed up just as Paul
stated except
that RX was also affected. RX signal was down using stock
antenna but
SMA-BNC adapter/BNC HT, Premier RD-9 and Comet
SMA24 antennas received
fine. What should have clued me was that I also had problems

with two
other different SMA-BNC adapters as well as the stock
antenna.
I checked the SMA connector on the stock antenna as well as
an RD-9 and
SMA24 antenna and several SMA adapters. I found that the
SMA connectors
on the RD-9 and RD-24 have long center pins with no shoulder
but that
the center pin on the stock antenna was narrower than on the
aftermarket
antennas and had a shoulder about 1/16 inch from the end of the
pin. I
checked the SMA connector on the radio and found that the
fingers that
contact the pin were spread slightly and the ends of the fingers
were
covered by the insulator (teflon?). Evidently in overtighting the
stock
antenna, the shoulder on the stock antenna managed to swage
the
insulator over the top of the contact fingers, at the same time
spreading the contact fingers to the point where they would not
make
contact with the center pin on the stock antenna and several of
the
SMA-BNC adapters with narrower center pins. Talk about tight
tolerances!

Solution: DO NOT USE excessive force if you try this! You are
working
with close tolerance parts. I used a sharp flat-blade 3/32"
screwdriver
to GENTLY shave the teflon insulator off of the top of the
contact
fingers. DO NOT DIG half the insulator out of the connector. It's
not
necessary. Only a tiny amount of material needs to be removed. I
then
used a 3/64" flat-blade screwdriver to push the contact fingers
SLIGHTLY
closer together.
After doing the above operations, all my antennas(stock and
after-market) and SMA-BNC adapters work fine.

As always, YMMV. :-)

346. [htaprs] RE: D7A questions...

From: "Phil Greenland" <pgreen@axom.com>
Date: Thu, 27 Jan 2000 22:38:26 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-62962-2000.01.27-21.35.58--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

1)The unit came with a 2.5mm rt angle plug to un-terminated wires for
hooking up to a GPS.
Where can I buy more of these cheaply?

********You can get them from Mouser Electronics Part #172-2010 About $3.95
each. 1-800-346-6673 http://www.mouser.com

2)How do I protect the SMA connector with external antenna cables, bouncing
around in the car.
Does anyone make a short SMA to PL-259 jumper?

*******Cable Experts http://www.cablexperts.com part # 183242sbj3 SMA TO BNC
ABOUT 30" LONG
NOT EXACTLY THAT YOU ASKED ABOUT BUT IT WORKS FOR ME

I'd rather not screw the big adaptor directly to the unit.
The Ideal adaptor would be a Rt angle SMA 6 inches of flexible coax and a
female PL-259.
The next best thing would be a RT-angle SMA to 6 inches of flexible coax to
any kind of connector.

3)So far I've been monitoring 144.390 with the TNC mode turned on, I
received one packet....
but I'd not yet figured out that TNC mode needed to be turned on.
So I missed it, after I turned TNC mode on I never heard another
packet...in 40 minutes of listening.
(I had to stop playing and go back to work ;-(   )

At Near 42.8982N
           71.0683W

347. [htaprs] Kenwood's Mcp_d700 software

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Fri, 28 Jan 2000 00:14:41 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-62991-2000.01.28-00.23.59--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In Kenwood's Mcp_d700 memory control software for the D700, I've found a "channel sorting" bug - anyone else noticed this and what can be done about it?

Steps:
1. I stored over 100 new memory channels including names for each one
2. Sort by frequency or name, doesn't matter
3. Save the filename as [whatever].700
4. Write to Radio
5. Close the file, and exit Mcp_d700
6. Reopen the [whatever].700 file
7. Now all the memory channels are unsorted, with many "blank" channel gaps between stored channels

So by selecting either sort option, instead of just leaving the channels in the original order in which I entered them, my memory channels are now all screwed up with no order in the memory file. You have to re-sort them after opening the file before you can Write any changes you made to the radio.

Lloyd -

I just took the antenna off of a unit barely 2 months old and found nearly the same thing -- small flakes of what looks like the plating metal on the threads. It doesn't just shake out either, you have to use a small brush or air nozzle to get it out. This may explain the premature failure of the finals on some units.

Good job!

I have the pinouts, but I was wondering if the Palm connector is available separately anywhere. If it isn't, what methods have you used? I want to get up and running with PalmAPRS

Thanks,
Joe

Kantronics makes a kit 2 watt Pkt Tx. 4" x 6" or so. Ramsey (if they still
exist!) makes a mini 2 m tx that might work for you also, very small.

I tried to contact Kenwood on a problem with their software for the D7A, and
they basically told me that it is at my risk to use it. I then asked for
the communications protocols to talk to the radio, I would write my own
program, and they wanted it I would freely give it to them, a program that
worked. They told me the protocols was proprietary and they could not give
the spec out. So basically we are stuck with bad software they won't fix.

One company that I was impessed with was Ten-Tec, their new computer
controlled HF rig comes with Windows software that actually fits on a
floppy. And if you want to write your own you can download the programmers
reference manual from their website, you don;t even have to pay for it.
Maybe Kenwood should "sit up and take notice".

Kenwood should either fix their software, or make available the
communication protocol spec.

I did this week. Use the D7A TNC selection.I don't have a lot of experience
with it yet, but it seemed to worked OK.

It's too bad about Kenwood....

I bought 2 of the D7A HTs when they first came out. Bad move. Found out right quick, you must be a hacker and a "make your own everything" person, (which I'm not) to actually USE Kenwood products. I couldn't even buy the PC cable and bad software for 6 months. I recently sold them, and could only get less than half price, at a hamfest.

I also bought a TM-V7A mobile, and had to wait about 5 months to get its PC cable and very bad software (compared to Yaesu's), which I still have and try to use. My other radios are 3 Yaesus and an Alinco, all pretty good, their accessories are available, and work flawlessly.

Sorry, but I developed a bad attitude toward Kenwood, and have vowed I will never buy another of their products. I've been watching and hoping the D700 would correct such problems, but it's obvious Kenwood hasn't learned any lessons yet.

It's obvious to me that Kenwood has really great product planners, fair product designers, but horrible support and supply departments and people. Well, I guess you can't have everything, but you wonder how much more market share they'd have if they could just bring out a product at the same time with accessories that worked at all. If they have management people worth anything, they'd be reading and responding to these problems, but apparently they're not hungry enough either.

All ham products from now on will need good PC programming and control software to go with them, but I don't see anyone else among the top companies who shares this opinion, yet. The first company who gets it right, (I think) will be surprised at the size of the "plug and play" market share out here.

For us "non-hackers" who want Kenwood products that will plug and play, we must wait at least 1 year after product intro, take a look then, and make a purchase decision.

I'm thinking of getting a D700 for my minivan. I understand that it
comes with a separation cable included. Can anyone tell me how long the
cable is and what type of connectors it terminates with (in case I want
to make a longer one myself)? I understand that Kenwood may offer an
optional cable (presumably longer than the one included with the radio)
but I' rather not have to buy the accessory if I don't have to.

The stock cable is about 10 feet long. It has a standard telephone style
RJ11 4 pin modular plug on the tranceiver end, and a smaller 4 pin
telephone handset style modular plug on the control head end.

I understand that it is human nature to expect a perfect product first time
out of the box but I think some of you are failing to recognize that the
D700 is a brand new product and Kenwood will need a little time to find the
bugs. I recall that the D7 had a few problems and that Kenwood offered a
"flash" soon after it was released. I know of no other radio manufacturer
that has supported APRS to this extent. Lets give Kenwood break! As for you
non-technical appliance operators that want everything handed to you "plug
and play", go find another hobby or get out the books and learn a little
electronics 101. To those that expected Kenwood to "give" them the source
code, go look at Jim Gill's page for the D700 at the link below. Jim has
figured out much of the sequence and taken the time to post it for all to
use. The software has not been officially released, to my knowledge, the
version on their FTP site is obviously not complete and bugs are to be
expected. Constructive criticism has always been considered by Kenwood,
many of the user suggestions have been incorporated in new products. I
think they should be congratulated and thanked for taking a chance,
producing an APRS product when the others have ignored it.

Jim Gill's site.

In reference to "Kenwood giving the source code". That is not what I requested. I was not referencing the 700 but the 7A. Kenwood stated they would not be making any changes to the software, and it was as is. What I asked for was the communications protoocl, the commands needed to talk to the radio. And as I stated I offered to give them the software I would write, and they could distribute. This was not in any way directed at the flash for the TNC side of the radio. Plus, on my TS-50S they provided the commands for the TS-50S.

You are correct, Kenwood has done for to provide a product especially designed for APRS, and even more than that. They have designed a product that provides extremely mobile data communications. I am not knocking that. I am however asking that if there is something they are not going to support then they should open it up for us "non-plug-n-play" people to experiment with, after all just as you say this is our hobby to experiment. The software to program the radio is an important part, it provides so much flexibility. And to have to work with buggy software, and not have access to a developer's kit? Then maybe Kenwood should charge for the software, and commit to supporting it then.

I have spoke to Kenwood many times, with no resolve.

One other item, I am a Kenwood fan, All except three are Kenwood, I have a Relm for EMS, a Yaesu because it was my first mobile and works great, and a $99 Alinco as an emergency backup. Also I lend the Alinco to CAP cadets to work with, and if it breaks, then I have not lost that much.

Last item on this. I was not bashing Kenwood in my email, just telling the
truth of experience with them and giving my opinion of that experience.
Which was addressing another email by a person on this list.

I will continue to negotiate with Kenwood and see if these problems can be
resolved.

As someone else stated, the Kenwood cable is about 10 feet long or so. The remote cable kit they sell for $80 is a lot of money and you can make your own cables anyhow.

The connectors are the modular telephone style "RJ" type plugs. Not a big deal, just make sure if you make your own to get either a female to female adapter that "flips" the wires around or make sure you do that yourself on the extension cable. If it doesn't make sense e-mail me and I'll explain or look at my e-mails from earlier this month on this on the archives.

The Kenwood kit is nice as it has extended cables for the head, microphone, speaker lines, etc. It also has all the mounting hardware, etc. But for the money they charge, I'd home brew!

To the list:

    All of us have to remember that Kenwood is trying to stay with in the guidelines that the FCC is laying down about having the ham community modifying their own radios.

    The laws that they are trying to push takes away the extended receive and the ability to mod our own equipment as well. It must be hard to stay in those laws and still conserve the hobby of the traditional ham as well. It has come from the "Bad apples" in the whole bunch as far as 11M and the scanner communities as well as the hams that have gone bad as well.
    Kenwood is trying to maintain the standard that they have always been at, but new and tougher laws may prevent that. Just something to keep in mind about any radio product that comes out in the future.

This is an excellent web site, and congratulate him on this endeavor.

This is the first I have heard of this site, this would be a good link to be

included on TAPR, strcilty because of the 700 capability for data and TNC
builtin.

Scott

Thanks, folks, for the positive comments on my work (two public comments,
probably eight or ten direct). I know I've promised to update with the
control commands "Soon", but I've been quite busy between work and my
recently started A+/MCSE classes.

I have done some additional research that just needs to be posted; I'll do
that as soon as I possibly can, among all the other for-pay websites that I
have to maintain also.

The actual release of the Kenwood software for the D700 did lower the
priority for me to update these commands on my site, since there became an
actual tool to manage the radio instead of doing it by hand. You may have
caught my recent sig message about some bugs in the software, and I know
there are some other users/software authors who are eager to see KW
"officially" release the protocol. Let me tell you, if you have any talent

at all dealing with programming, visual basic, etc., then all you need to do
is see my page for the instructions on how to turn on the port in the radio,
then just watch the data fly by. You will learn all you need to know in a
hour or so of fiddling with it. For HT owners, there is a link at the top
of my page to VK2TDS's previously released D7 "cheat-sheet".

Anybody that has sufficient programming and analytical skills should be able
to produce a workable piece of software just by referencing my site and
playing with the radio on their own. If after that, you still don't have
what you need, then KW or anybody else won't be able to help you. Spend the
time to bone up on your troubleshooting/discovery skills before trying to
write software. There are likely others already working on it "behind the
scenes".

I rarely attempt to take a position on the sig that may be deemed offensive
to some, but that's about the only way I could really put it.

 What is the big deal??!!??!! guys on this SIG figured out the protocol for
talking to the D7A back last summer, months ago ... of course they probably
aren't going o upgrade the software ... so many hackers have made better
programs that they cannot hope to recoup money spent on upgrading
maintaining the program.

There are NO guidelines regarding the amateur radio community modifying
radios! That is such a common misconception! The ONLY thing a ham cannot

do is modify a radio to receive cellular telephone transmission.

We can modify, carve up, improve, our radios all we want. Haven't you ever heard of the term: HOMEBREW?

Perhaps not. In this age of appliance operators it's no wonder. Well, if it ain't illegal for me to BUILD a 2M rig, it ain't illegal for me to modify it!

Message-ID: <LYR845-63329-2000.01.29-17.28.21--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Thanks to those of you that sent me the JPG and GIF files. I incorporated them into my ASTARS web page, described adnauseum in the previous EMAIL:

But if you didnt read it and want to cut to the screen shot, here'tis:

 http://web.usna.navy.mil/~bruninga/aprstk.gif

Its a DOS screen of APRStk.exe, showing the 2.5 hour graphical time line of SATELLITES across the bottom. It shows each pass and the max elevation. Nice for knowing when to expect your favorite birds, without having to run a separate program...

If you have a THD7 or TMD700, you should consider a handheld beam to get maximum fun from your new radio! (The dual band ARROW is pricey, but is all-in-one).   But since the uplinks work fine from the 2m whip, you need only the UHF beam on the downlinks (and a VHF/UHF diplexer to split the two).

Enjoy, Bob, Wb4APR

369. [htaprs] OPAL Heard on mobile!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 29 Jan 2000 19:15:12 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-63333-2000.01.29-18.13.17--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Went out with 1/2 arrow antenna held out the window (East) of the mobile and the TMD700 radio on 437.105 BEEPED and showed "??KF6RFX" on the front panel. This means non-APRS formatted packet. I pressed PACKET-MON button and the display showed the full packet:

   KF6RFX>CQ:OPAL 0:0006684204 <01>

And later to the southeast on 437.095 (from Maryland), I got:

   KF6RFX>CQ:OPAL 0:0009948696 <01>

This is using only 4 elements of a half ARROW antenna. The decoded ones

were hitting two segments on the S meter. I heard several more at the 10
sec rate but without a steady signal it was hard to be pointed at tthe
right place at the right time.

Next overhead pass, Ill just leave it connected to the omni WHIP antenna
and stay inside and see what I got the next time I drve the car... :-)

Rendered body type: text/plain

No additional equipment needed. Just get a 9pin female to 9 pin female
serial cable from Radio Shack (26-152 $9.99). Hook this cable from radio to
PC, use any terminal program such as terminal.exe, HyperTerminal, ProComm,
etc. Set the communications settings to 9600 baud, 8-N-1.

When you have your communications program running and the connection "open",
type

AI 1

Then vary the volume control or change the frequency. You should see data
coming in from the radio. Many of the data type indicators will be
intuitive:

AG 0,xx = Volume for band 0 to xx (Audio Gain)
LIST 01,call,date,time,x, etc etc

See what you get and ask if you have a question what you are seeing. If you
get nothing you need to do some more troubleshooting... port, cable,
software configuration, etc.

Hmmm...

Buggy software? I seem to remember my original copy of the ADMS-1 software
for my Yaesu FT-11 was full of bugs and I paid over $40 for it. The
company that wrote the interface software for Yaesu wouldn't even talk to
me, and they wanted more money to upgrade to a newer version of the
software (basically the same cost as buying another interface).
Furthermore, the PROPRIETARY interface that came with it was poorly made

and the interface cable would twist inside the DB-25 hood and short out.
So I ended up doing some soldering on it, too...(so much for plug and play)

My FT-51R was purchased the first month they were released. It too had
firmware flaws, including the scan step bug. Also the side selector and
PTT buttons both failed very early and had to be repaired on an SMT rework
station.

When I bought my FT-8500, one of the selling points in the literature was
that all memory information on it was stored on an EEPROM, and that it had
NO battery to fail. One month after the warranty expired on the radio it
started to lose it's memory when disconnected from power. I sent it back
to the factory and was informed that a diode had burned out, allowing the
ON-BOARD BATTERY to drain, causing the loss of the radio's power on memory
state. $65 to replace battery and diode plus one hour of bench time.
Nobody at Yaesu could explain to me why their literature (and my user's
manual) say that the FT-8500 has no battery to fail.

A few months later the 8500's faceplate took a dive, and I damaged the
multifunction selector switch. This time I determined I could fix the
problem myself, so I called Yaesu and asked their "expert" opinion on what
parts I would need to fix it. The parts guy said he knew exactly what I
needed and he would send it out. I also ordered a service manual at the
same time. A few days later I received a box with about a half-dozen parts
in addition to the selector switch, including a new LCD panel, which I had
indicated I did not need. I called Yaesu to get an RMA number on the parts
I wanted to return. They wanted to charge me a 15% restocking fee on them.
 After I protested they finally relented and promised they'd credit my
Mastercard with the proper return amount. A month after I had returned the
parts I still had not received a credit, so I called them again, and was
promised the credit would show up on my next statement. Well, the next
statement came and instead of crediting me with the RMA parts, THEY BILLED
my credit card again...TWICE. So now I had like $385 charged against about
$50 of stuff I actually bought from them. It took several phone calls and
over 90 days for Yaesu and Mastercard to figure it out.

OTOH, I bought my TH-D7 last year at Dayton, went over to the Kenwood booth
and they gave me a free SMC-32 speaker mic. Yaesu has never given me
anything free for buying their products (at least $2500 worth in the last 5
years), unless you count that baseball cap...   I was able to go home and
MAKE a high-quality interface cable for the TH-D7, spending about $8 total
and then download a FREE piece of software to program it. So, the program
is not perfect, but it works as well as the $40 piece of software I got for
my FT-11/51.
Plus, they make the manual available in .pdf format, something that the
other manufactures seem to think isn't important. I put a copy of the
manual on my laptop and on my computer at work. I can not tell you how
nice it is to be able to access a user's manual for the radio w/o having to
worry about lugging around or losing the paper copy of the manual.

A few years ago I had written off ever buying an amateur radio product from
Kenwood, but it seems to me they are far more interested in front-end
customer support than the other manufacturers, as well as going out on a
limb and making some pretty cool APRS radios. I'm looking forward to
purchasing a D-700 in the near future.

Ditto for the Yeasu software I bought for the Vx1R. I even sent it to RT
systems who built it and they said it was fine but it would never work
with my radio. I finally sent it back to HRO (Thanks Gary at Phoenix for
being so understanding) and all the whole experience cost me was two sets
of postage for shipping it all around the country.

I had Kenwood HF rigs, TS520 and TS 820 but then went to Icom when they
came out with their solid state rigs.   The TH-D7 and TM-D700 are the
first Kenwoods I have had since then and they are great!!! Really neat
rigs and the software works fine. I was particularly impressed with the
fact the D700 software would allow you to import any D7 files you had
saved for it. Neat to be 'backward compatable' so to speak.

It's great to see continuing interest.
It was a little overwhelming the first time I started looking at APRS
There is quite a bit of information available; I've posted a few links
The simple home station is
APRS-Software ----PC---serialconnection---TNC--connection---VHF on 144.39
  The APRS software can be one of the several available
  I use APRS+SA which uses the Street Atlas Mapping program from DeLorme
  I also have WinAPRS registered and like it's use of the FFC database for Ham
License Info

The simple tracker is:
  GPS --connection---TNC---connection VHF on 144.39
    It depends on the capabilities of the TNC. I use the Kantronics KPC-3+
    the KPC-3+ has good features and GPS support.

I'd start with the home station without a GPS to get started.
(The APRS+SA can use an internet connection to allow you to start viewing)

http://users.nbn.net/~gwells/links.html

http://nwaprs.org/

Once you pick your PC software, post a note if you need help filling out your
station/path etc.

Good Luck and have fun

OPAL's signals are HUGE. Really strong beacon. I was copying them at 57 or
better last night.

Now, I forget, does OPAL have ham uplink and downlink capabilities to be
utilized after it's payloads are ejected?

Listening to ARRL audio news this evening, I'm trying to make heads or tails
of all the new satellite stuff going on. I have a D700 that I want to
experiment with using just a good OMNI. I have read Bob's ASTARS page, but
would like to find somewhere that gives a further summary of what satellites
are now up, with frequency lists for uplink possibilities and downlink
telemetry monitoring.

Right now I think I understand:

jawsat   400.475 downlink (freq???)
stensadt: up 145.84 dn 436.625
opal telemetry: 437.100
>From Bob's page: up 145.9, down 435.13

Can someone clarify or point me to a resource for further study? Thanks.

PS I'd like to assess the viability of taking my D7 or D700 with me to Hana,
Maui, HI March 25-30 for satellite comms, either voice or data. Will be
quite remote for a few days so could even just use the radio with voice
repeaters on Mt. Haleakala. Someone on Maui should set up a digi/Igate up
there (maybe at the Air Force AMOS facility on Mt Haleakala).

Well, OK, if I must tell you: 40 elements circularly polarized. So it's not
to wonder it's so good.

Really though, it's a relative signal. When working guys on AO-27, I've
never heard AO-27 THAT well. So if guys can work AO-27 with whips, you
should be able to hear OPAL really well with just a whip as well.

OK, NONE of the new Satellites yet are ready for use.

JAWSAT was the launching platform used for all the satellites. It also
contains Weber-2 which is a ham-capable satellite. I believe it is a
digital bird (but am not sure). But people have been having trouble hearing
it. So the health of the bird is unknown. Beacons are at 437.075 and

43.175.

If anyone hears it, send me an e-mail and I'll get it to the right people.

The 400.475 downlink freq you have listed is FALCONSAT which is an Air Force
bird built by students at the Air Force Academy.

Stensat is an FM voice repeater similar to AO-27 (2M up, 435 down). It is
voice only and will be launched from OPAL either tonight or tomorrow
(hopefully).

ASUSAT is a satellite built by students at Arizona State University. It has
an FM repeater capability and I believe digital capability as well. Health
or status is unknown at this time. I've not heard it nor have I listened
for it.

OPAL is a launching platform for Stensat, 3 birds named ARTEMIS and a couple
other satellites. The ARTEMIS birds will downlink on 2M and are not
available for general Ham use. They were built by female grad students at
Santa Clara University. They contain VLF receivers and I believe they are
going to use them to study lightning in the upper atmosphere.

I am not sure if OPAL has any amateur uplinking capabilities or if all we
will be able to do is listen to the downlink.

So now you know what I know!

I wouldn't count on any of these birds being available for APRS yet.

If anyone wants to view live data coming from a TMD700A through the serial
port, I am offering SCHEDULED, LIVE telnet sessions for you to connect to my
radio via your telnet client. I will be using TCPTOSER on this end to offer
the 9600 baud ascii control port data out on a specific port number.

As I have dial-up internet access only, please contact me if you are
interested in scheduling a time to connect to my radio to see the data flow.
I also have NetMeeting for voice or text chat alongside the telnet session
so I can explain what you are seeing. This will not be a full-time thing,
just occasionally to those that want to see it [primarily evenings]. Please
contact me via direct email *only*.

TRUE ,TRUE. HOWEVER, If you modify an AMATEUR radio to operate in the
commercial or law enforcement bands, AND OPERATE in those bands, you are
guilty of using a non type accepted radio in frequencies where type
acceptance is required. There have been legal issues raised in the past
over this type of operation, even when life and limb have been threatened,
and I don't want anyone on this thread misled into believing that OPERATING
an AMATEUR RADIO on COMMERCIAL and LAW ENFORCEMENT frequencies is okay,
cause it AIN'T. By OPERATING I mean TRANSMITTING as well as recieving. You
can listen all you want, but it is ILLEGAL to transmit on commercial
frequencies with non type accepted equipment.

Of course. If you TRANSMIT over the air on non-ham frequencies, then yes,
you are breaking the law. But the law prohibits transmitting, NOT

modification.

But not all transmitting outside the ham bands is illegal. Not at all. I may be using my 2M FM rig as an IF source for a transverter to operate FM on say 1296. The FM portion of 1296 or even say 70 cm is MUCH larger than 4 MHz, so I may need to operate outside the ham band.

So jumping on guys who want to mod their radios to transmit outside the ham bands is not necessarily a good idea. You don't know what their intentions are.

Glen, your path is probably still good, presuming you are seeing your
packets reflected back after your transmit.

I have noticed that the internet feed to APRS has not been stable lately.
For whatever reason, the www.aprs.net:8000/callsign does not work very
often. E-mails to Steve Dimse KH4G have gone unanswered.

I do find that   http://maps.aprs.net/callsign works more often that the
:8000 URL.

389. [htaprs] APRS Telemetry from STENSAT

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 31 Jan 2000 16:27:36 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: aprsnews@tapr.org, amsat-bb@amsat.org, htaprs@tapr.org
Message-ID: <LYR845-63695-2000.01.31-15.25.33--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Good news, bad news, good news....

THE GOOD NEWS:

> I am happy to report that the STENSAT telemetry was built from a
> modified APRS MIM and therefore the telemetry will be APRS decodable!
> So when the satellite is deployed on Wednesday, we should be able to
> capture it with your APRS software and more importantly with just your
> Kenwood integrated APRS Radios!
>
> de WB4APR,Bob
> ---
> From: Hank Heidt
> Cc: Assoc Prof Carl E Wick
>
> StenSat's telemetry should be APRS compliant.
>
> N4AFL-1>TELEM<UI C>: T#000,255,004,037,129,032,010 STENSAT PICOSAT
>
> where the Telemetry numbers are (in order):
> Sequence number - goes to 255, then rolls to zero
> Power supply monitor
> Current monitor
> Temp monitor
> 2.5 volt reference
> Current RSSI value
> Three light sensors (low value means light is striking the sensor):
> Light sensor values are (in order):
> Flat face (3 by 4 inches)
> Long side (1 by 4 inches)
> Short side (1 by 3 inches)

THE BAD NEWS:. THe AX.25 destination call of TELEM they are using is not
one of the generic APRS filters. SO most APRS software should ignore it.

THE GOOD NEWS: In the Kenwoods you can change the given UNPROTO or ALTNET
call from APK001 to TELEM, to set your radio to operate with ONLY other
stations using that ALTNET callsign and then your THD7 HT or TMD700
mobile radio should receive the STENSAT telemetry directly...

THE BAD NEWS: is that if you forget to return your ALTNET setting back to
APK001 (for the HT) or APK101? for the mobile radio, then you wont copy
any more packets on 144.39... SO dont forget!

Most other APRSversions have a switch where you can disable the front end
ALTNET filters for special circumstances such as this...

Got my fingers crossed for the deploy!

de WB4APR, Bob

Richard, if you are referring to the HTAPRS list accomodating discussion of both the THD7 and TMD700, yes, it is already occuring. The list name used to refer specifically to the Kenwood HT, now it means "Hot Technology", so it covers a wider scope of newer hit tech radios.

If you are referring to cross-posting Kenwood radio-related information to APRSSIG, it does happen; however users are asked to keep as much of the Kenwood D7/D700 stuff on the HT list if at all possible.

Rendered body type: text/plain

I opened the newly acquired 202 today as a result of noticing that the mic and speaker are plug and socketed onto a pc board inside.

What I found is what appears to be enough room to fit a MIM
module and wire it directly to the 202 inside, and possible
route the GPS cable (GPS135) through the unused speaker
jack.

Radio looks well built, well heat sunk on the TX side.

Cheers, Adrian

1. [htaprs] D700 Packet Mode

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Tue, 1 Feb 2000 02:20:22 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-63866-2000.02.01-02.18.57--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Discovered some new things playing with the TMD700 in PACKET mode. There are a few things in the TNC command set that are not in the manual:

SOFTDCD ON
GPSFILT1
GPSFILT2
GPSFILT3
GPSFILT4

It apparently has selectable SOFTWARE DCD (True? DCD) when in Packet mode only. I set SOFTDCD ON, then left the squelch all the way open, with volume high (so I could hear what's going on). When I connected to a local BBS, it ignored the open audio and transmitted when it needed to. However, it looks like it's not playing nice, because it transmitted even when there were other strong packet signals on frequency. I was set for 1200 baud on a 1200 baud network. Now I need to experiment and see if SOFTDCD carries over to the APRS mode!

The GPSFILTx commands are not in the manual, but looks like it may have something to do with GPSTEXT. Anyone else seen this or know what they're for?

I'm sure there are lots more goodies waiting to be discovered here - just starting to work here on documenting the PACKET side of the radio. I'm off to capture UO22!

Well, the TH-D7A has a SOFTDCD command but it doesn't seem to work - at least not at 9600 baud. The radio would not transmit with the squelch all the way open. I guess the pendulum swung too far the other way with the TM-D700????

You may wish to note that the decode ability of the TM-D700A and TH-D7A TNCs as compared to say a KPC-3+ is rather poor. My KPC-3+ REGULARLY decodes packets which don't even show up on the S-meter. For the Kenwood TNCs to decode a packet, you need to have a full scale reading (I think the TM-D700A manual even says this!). That is one of my gripes. And to you hyper folks out there, no, this is NOT Kenwood bashing, it's a fact and Kenwood needs to realize it and improve their TNCs.

So given the fact that the Kenwood TNCs are not real good at decoding

packets and miss all but the strongest (if you doubt me, watch how many APRS packets do not get decoded during a drive to work), SOFT DCD may not be the answer. If a packet comes in at 3/4 scale, the TNC might not recognize it since it can't decode it and so it transmits.

My guess is audio DCD is unfortunately the way to go on this. And since you can't decode packets in the noise, well so what.....

Rendered body type: text/plain

I believe DCD is not the right use of the abbreviation. The setting which is labeled DCD on the D700 appears to be only a open squelch detector. I have not formulated an opinion on what method is the best yet. I am leaning toward believing hardware is the best solution I have seen.

I have not had the experience of setting up the D700 on a fixed antenna with proper grounding yet, so I can't comment on it's ability to decode packets there. I can compare the radio to my last setup in the mobile which was an Icom IC2000 and a Tiny 2 with hardware DCD option. At 1200 baud I perceive the D700 to be ever so slightly better on receive, and clearly better at transmit. I am guessing that this could be due to the fact that the D700 TNC audio levels are set in a measurable, and controllable environment within the radio. I can't say that about my Icom/Tiny 2 setup.

Although I am pleased with what appears to be a better mobile setup, I would like to see if there are any published specs that anyone has run for TNC performance. Are there measurements that we can apply to TNC/Radio combinations? I think we can all agree that the arbitrary S meter on most radios are not a good measure of performance compared to received and decoded signals.

I've been curious about this feature. I'm not sure how to use this
feature. According to the manual, it is supposed to filter data.
I've set it to values other than APK001 (I tried TELEM) and left the
radio on 144.39 -- just to see what happens. I saw no change in the
TMD7's behavior. I seem to receive all data. All APRS data display
and all stations appear when I press the list button.

Steven

Well, it depends. I think a properly "transmitted" 1200 baud packet it
receives very well. But it does appear that it has problems with most of
the non-optimum packets we see on the air. I would love to hear what two
THD7's can do between each other....

ALSO, please note....
  At 9600 baud, the radios willl decode with only 1 LCD segment
lit. and even will get short packets with NO LCD's lit! Remeber, the
Kenwood radios evolved from mobile Kenwood data systems in JAPAN that use
9600 baud. My thought is that they took this "excellently" engineered
9600 baud system and then figured they had to add a 1200 baud capability
to work with APRS in the USA.

I am now using my THD7 as my 9600 baud satellite downlink receiver using
only a 19" whip on the 435 downlinks, and get good data whenever the
satelite is above 20 degrees. Remember, most other pacsat operators are
using 8 foot long high gain UHF cross polarized arrays to do the same
thing... (but they get twice the pass lenght since they can capture all
the way to the horzon... I cant due to my lowergain omni antennna...

So, anyone want to get some quantitive data with one D7 receiving anotehr
D7 (direct?)

bob

> decoded signals.

For the APRSat that never made it, I tested the THD7 in receive against
our KPC-3 in the satellite driving a HP sig gen to make sure the
modulation was perfect. The THD7 decoded packets down to -119 dBm. The
Kewnood engineers claimed only -117. So even if you take the more
conservative value of -117 thats full packet decode at 0.3 Microvolts.

Or if you believe my test, thats 0.25 uv....

Pretty darn good. But then I would love to see more data....

7. [htaprs] rubber ducks with counterpoise

From: jfkorenz@goodyear.com
Date: Tue, 1 Feb 2000 12:11:18 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-63918-2000.02.01-11.07.41--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All,
     Well here is an update on the antenna tests. This
time the 2 M tests were run with a "ground plane" or
counterpoise consisting of four, 19 inch long #18 copper
wires soldered to an 1 1/2 square piece of brass

shim stock. The brass piece was wedged between the
2 connectors in the unidapter connector. In all
cases, the return loss was worse. In all cases
but one, the antenna's resonant frequency did not
change. You can draw your own conclsions.

Kenwood TH-D7A antenna

max resonance at 160 MHz return loss = 9.5 DB SWR= 2.0 (2.0 DB)
144   2 DB SWR 8.7   (2.0 DB)
145   2.3 DB SWR 7.8   (1.7 DB)
146 2.5 DB SWR 7.0   (1.8 DB)
147 2.7 DB SWR 6.5   (1.9 DB)
148 3.0 DB SWR 5.8   (2.0 DB)

max resonance at 312 MHZ return loss = 7.5 DB SWR = 2.5
420 2 DB SWR 8.7
430 2 DB SWR 8.7
440 2 DB SWR 8.7
450 2 DB SWR 8.7

COMET SMA 503 DUAL BAND ANTENNA

max resonance at 151 MHz return loss = 4.2 DB SWR = 4.2   (2.0 DB)
144 3.2 DB SWR 5.6   (1.7 DB)
145 3.5 DB SWR 5.0   (1.8 DB)
146 3.5 DB SWR 5.0   (1.9 DB)
147 3.6 DB SWR 5.6   (1.9 DB)
148 3.7 DB SWR 4.8   (2.0 DB)

max resonance at 460 MHz return loss = 20 DB SWR = 1.22
420 6 DB SWR 3.1
430 7 DB SWR 2.6
440 9.2 DB SWR 2.05
450 12.5 DB SWR 1.62

ICOM FA-S270B SMA TRI-BAND ANTENNA FROM T8-A

max resonance at 146.3 MHz return loss = 18 DB SWR=1.288   (9.1 DB)

Interesting! Hummh...
Well, it "should" have filtered data.. and I did the same test before I
sent that Email, and mine did ignore everytthing except packets to TELEM.
Remember, there is lots of wildcarding going on. ANYTHIng beginnning with
APxxxx will still accept ALL aprs packets. Also, all raw GPS trackerrs
will also get though as well as all other Mic'E's. IE, anything that
doesnt use a possible ALT-NET call must get thorugh. But anything that
does have a different alt-net call, an also not matching any of the
wildcards, shoudl not....

Can you confirm that?

10. [htaprs] info needed for Telemetry from STENSAT

From: "Peter ZR5DWC" <zr5dwc@iafrica.com>
Date: Tue, 1 Feb 2000 19:40:04 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-63926-2000.02.01-11.35.26--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

Please could some one supply me with some info for STENSAT.

I just need to know the following.

Uplink (If any) Downlink (144.390)
Unproto (TELEM)
data speed 9600 or 1200bps ?

And if any one know's of any good passes over South Africa.

I hope that this will light the fire of intrest again with APRS in South
Africa. It seem's to have died out over the past few day's.

Many thanks

Peter

I would think it would be better to test the antennas on a dummy radio
chassis held in a normal talking position by a human. IMHO

12. [htaprs] Need source for tripmate and D700 GPS tip plug

From: "Richard Carter" <rcarter@isi.com>
Date: Tue, 1 Feb 2000 12:18:22
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-63928-2000.02.01-12.15.30--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm tired of my Garmin GPS sliding all over my dashboard, so I'm looking
for a small, self-contained GPS sensor like the tripmate. A quick search
turned up no suppliers, however. It appears that the earthmate has
replaced the tripmate. Does anyone have an suggestion for an inexpensive
replacement for the tripmate, or does anyone know where they can still be
purchased?

Also, Radio Shack does not sell 2.5 mm two conductor micro-phone plugs.
I'd like to wire up a second GPS cable for my D700. Does anyone know where
these plugs can be purchased?

Thanks
Rich Carter - KE1EV

Not that I know of. and I hope I would be the first to know...
Too bad. I find them a remarkable companey with good enginners and an
interest in giving amateur radio what they want and need...

But I guess one can always find bad examples... :-(

Bummer

I have purchased a Rand-McNally GPS, that is very much like the TripMate, and it outputs NMEA. But I have not tested it yet, hopefully within the next few days. They can be purchased at Best Buy for $79 (incl StreetFinder software). Or directly from RM fro $79 just for the GPS.

I have seen on this list where some have gotten it to work.

purchased?

Also, Radio Shack does not sell 2.5 mm two conductor micro-phone plugs.
I'd like to wire up a second GPS cable for my D700. Does anyone know where
these plugs can be purchased?

Thanks
Rich Carter - KE1EV

> I'm tired of my Garmin GPS sliding all over my dashboard, so...

This isnt the answer you were looking for, but I saw K5QQ using sections
of rubber carpet non-skid to hold his laptop, GPS and RADIOS and was
absolutely amazed. Duct tape wont even stick to modern dashboards, but
this non-skid rubber stuff wont slip until the car turns over!

I went right out and invested a few bucks at the nearest hardware store
and cut it up into lots of 6 inch squares. Now I can place anything
anywhere in the car, on the seats, dashboard, floor board, carpet, and it
stays put! I was kicking myself for not having discovered this stuff 20
years ago in my amateur radio carreer.

NO, THIS WILL NOT PASS GOVERNMENT OR OSHA requirements for DRIVING
SAFETY... but it works :-)

Bob

Good question. I went to a fabric store and they had what they called rug
non-skid. But it wasnt it.. I then went to ACE Hardware and it was the
right stuff. It is carpet non-skid for throw rugs.

The stuff looks kinda like cheeze cloth that has been dipped in goop...
(Its dry, of course)... In other words an open weave with the consistency
of rubber bands...

Hope that helps.

Oh yes, things will FLY and ROLL OVER but they wont "slide" <grin>

You can also find this stuff at Wal-Mart in the shelf paper area. It's just like
Bob described and comes in tan, blue, etc. Housewives use it to protect delicate
dishes etc.

>

Well I am certain that my KPC-3+ will decode MORE packets than the TM-D700A
or TH-D7A.
And this makes no difference regardless of whether or not the packets are
"properly" transmitted.

This morning on the way in to work, I watched the packet monitor and very
few packets actually got decoded.

Anyhow, why not compare a TM-D700A to a KPC-3+?

I am glad though that the 9600 baud side seems to be better. I was curious
with how it would
work with the PACSATS being that it is rare you get a satellite that gives
you an S9 signal.

Thanks all for the help. Delorme still has a few tripmates in stock. I plan to order one just as soon as I verify that this is the best available price. I suspect that it can be used without modification on the D700 by wiring power in from the radio serial port. This means making a simple custom harness. This would protect my warranty.

I plan to occasionally remove my radio from my car and mount it on the boat. She has a JRC GPS, hence my question about finding a supply for that tiny tip plug used to interface the gps to the radio. No responses on that, so I guess everyone is puzzled. I did find a 1/8th inch to 2.5mm adapter at Radio Shack, but this is a messy solution. I can see accidentally tugging on the GPS cable and snapping off the plug. Kenwood could have selected a more robust connector.

Sliding around the dash is not the only problem with using the Garmin. Having it on the dash invites theft, overexposure to sunlight is bad for the display, and most importantly, it doesn't turn on/off with the ignition key; well maybe it would if the internal batteries were dead, which is assured in short order if I forget to turn it off. On the whole, the Garmin is poorly conceived, but it is paid for...

Thanks

Well, you are still gonna have to trick the Tripmate into working somehow.
It needs to hear "ASTRAL" on the rx data line to initialize, and
coincidentally sends ASTRAL on the tx line at powerup. The common mod is
to open it up and do a little soldering.
http://www.qsl.net/kd4rdb/tripmate.htm has the details. I suppose you
could make your custom harness do the same.

Oh, and the other part of the mod is to put the Tripmate into STANDBY mode
at powerup, so it will send ASTRAL out the tx pin. You'll have to do that
in your harness, too.

FWIW, I'm using a Tripmate with my D700. I modded it internally, and am
using the Delorme lighter plug to power it.

Subject: [htaprs] Re: Need source for tripmate and D700 GPS tip plug

I have purchased a Rand-McNally GPS, that is very much like the TripMate, and it outputs NMEA. But I have not tested it yet, hopefully within the next few days. They can be purchased at Best Buy for $79 (incl StreetFinder software). Or directly from RM fro $79 just for the GPS.

I have seen on this list where some have gotten it to work.

I am also using a Tripmate with the DM-700. I made the auto start mods in a harness, and the voltage regulator internally. I have a question that I'm wondering if anyone has seen yet. When using this configuration, and going

into PMON mode, I see the TNC doing this:

$GPGGA,231207,3820.9939,N,07624.4219,W,1,04,1.23,-35.1,M,-33.9,M,,*55 with
GPSTEXT was $GPRMC

and visa-versa

$GPRMC,231206,A,3820.9939,N,07624.4219,W,0.000,0.0,100199,10.9,W*40
GPSTEXT was $GPGGA

Is this causing any problems with parsing, and sending GPS data? It sure
seems to take up a lot of bandwith on the radio it self, switching back and
forth between. I imagine can't change the Tripmate's sentences with out pre
processing it with at PIC, but is there a setting I can change so the radio
will be happier with both sentences?

Dennis, N2LBT

Has anyone any experience with this reciever. I got one in a mapping package from DeLorme called 3d
Quads and have ytet to get it to work. The data stream seems to be proprietary or I'm looking at
gibberish. It runs at 4800 baud and if I go by what DeLorme says it is working, but it never gets an
almanac or resolves a position. In using it with Delorme 3D Quads or STREETS software and using an
enhanced terminal program from DeLorme I see only data streams that are mostly zeroes.
 ANY HELP PLEASE

Thanks

It spits out a Rockwell binary datastream. There's a PIC out
already that will translate this into NMEA sentences. Check out

http://www.c2-tech.com/~steveb/ka9mva/earthmate.htm

I have the Rand McNally gps.

It looks like a black computer mouse. Easy to hook up.
It comes with a cable that has both a DB9 serial connector
for connecting to your serial port and a PS2 connector for connecting to
the mouse port for power. Easy setup for a laptop. Not quite so for a
tracker. It works on 12 volts (I think someone reported 6 to 16
volts is OK). If you cut off the cable before the DB9 you will find
the +12vdc (red), data out, data in and ground.

It works OK, but is not as sensitive or as quick locking as your Garmin.
I have a 12XL that locks in 15 or so seconds. The Rand McNally unit
takes over four minutes,every time. Not an issue if powered and parked
in the clear continuously, or if used when the first four to five minutes
are not needed. It does work well on the dash or rear deck, but is not
sealed for outdoor exposure. Mine doesn't work at all when garaged.

Garmin makes a similar appearing unit, the 35 TracPak, that I'm sure
works better, since it has the same 12 parallel channel receiver as my 12XL.
It's also available as a model 36 TracPak, in white. Both are available
directly from Garmin for about $150. If I was going to get another,
I'd save up for the Garmin. For the price, though, the RM is OK.

Greetings folks,

Bob WB4APR was not kidding when he said :

> NO, THIS WILL NOT PASS GOVERNMENT OR OSHA requirements for DRIVING
> SAFETY... but it works :-)

It's time once again for my annual reminder to all
that putting *anything* on or in front of your
dashboard is just asking for a disaster ! If you
have a modern vehicle, it very likely is equipped
with "air bags".

These devices contain a very high explosive charge,
which in the event of an accident "deploy" with
unbelievable velocity. (The less you know about
how an air bag works, the better; and all three
of the U.S. makers want it kept that way !)

One option, in Canada only, is to have the air
bag(s) removed. (We all wear our seat belts and
are not required under Canadian law.) In the U.S.
you, I believe, have to jump through hops to get
them turned off or removed.)

The *other* option, is to read your Owner's Manual,
you know, that book that, by Law, must be in every
vehicle manufactured - and the same book that only
14 % of you ever read; and then, only when there's
something wrong with the vehicle !

If you have the *slightest* doubt about how your
airbags could "deploy" and where it's safe to mount
your GPS and / or radio equipment, please contact
the service manager of your local dealership. All
of the Big Three have various technical bulletins
which address this issue. Don't risk it; ASK !

Remember, the life you save might not be your
own, but someone whom you love very dearly !

My vy 73 to you all, de John VE3NEC

No idea. I have tried emailing RM asking questions such as pinouts, etc.
And they have plainly said that the will only support it for what they sell
it for, their software.

I will be sending in a letter to the president tomorrow asking him to
address Ham issues since the Delorme GPS (Earthmate) does not support NMEA
output.

If anyone else wishes to write a letter, email me and I will forward the HQ
address -- smorris@mindspring.com

Greetings SIG,
Have a look at http://www.delorme.com. I was talking with a support rep
there two days ago and he said that they had Tripmates for sale. They
are also on the web page under "older GPS's" or something like that.

73,
Kevin Kelly/N6QAB

Rendered body type: text/plain

I have a RM GPS, that I remounted in a Radio Shack plastic box (270-1803).
I bolted a old magnet mount magnet to the outside of the plastic lid, large
fender washer on the inside. Mounted the receiver board with the antenna
on 3/4" 4-40 standoffs off of the lid. Carefully drilled a hole in the end
of the box, just up the side from the lid for the cord, so that when I
tightened the lid to the box it slightly crimps the cord. I also have a
1/8" cable clamp inside to keep the cable from pulling out. I mount the
box on the roof of my old chevy truck, get 8-10 sats now. I'm using this
with my Kpc3+ (8.3) and Yeasu FT-26, as my tracker. Works great.

Shane

Its pretty close - 55mA typ @ 12VDC
Check out http://www.talon.co.nz/frames/gps1200.htm
it's there "Integrator1202" board with a ceramic patch antenna.

Yes I did, also I set the jumpers 6 & 7 to feed the power through pin 7 on
the db9 connector. This way I could use the power connector on the kpc3+
for the main power feed, the GPS and Yeasu HT receive theirs from pin 7 and
9. MAKE SURE TO OHM METER THE JUMPERS! I found the book was wrong!

HRO sells the GPS brackets that are velcro or suction cup maount to keep the
GPS from sliding around:
http://www.hamradio.com

I have the one for the GPS 12 and it mounts to the dash with velcro and I
also have the suction cup mount for my 53 Willys as well.

I have found that the gooseneck mount with suction cups to attach to the
wind shield helps avoid the airbad issue if palced in the center of the
dash. This also works to be able to see the units as well and still be able
to read the display. I had to modify the gooseneck to get all three units
hooked to the same mount but it worked. I hear that they are working on a
transmission mount gooseneck mount for the units but have been so far unable
to confirm this. Is it really neccsecary to be able to read the GPS? I
find myself looking at the Plam more than the radio or the GPS myself unless
there is a problem.

Just my $0.02

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64127-2000.02.02-12.26.33--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have a new DH7A and I am not sure if it is working....
I have it connected to a GPS and I had it in my car this morning:

Call set to Kl7JG-7
Set to Auto Beacon every 5 min.
GPS position was appearing in My Position menu, so the GPS interface was
working.
External Mag mount antenna.

I drove down to Bedford Ma and over to Woburn then back north to NH.
I received lots of APRS traffic on the unit, I saw it transmit my position
periodically.

I also saw it flash "My Packets", so it could see that my packets were
being digipeated.

When I got home I rushed to my computer and entered:

www.aprs.net:8000/KL7JG-7

It did not find me.....

Is there some special setting to get the packets to be put through the IGATE.

Does anyone have logs that would show my track this morning....
(0730 -> 10:30 EST)

Paul (Kl7JG)

What was your path set to? Are you hearing digipeats come back after
your posit goes out?
Where is your closest igate? Does your path allow your posits to get to
the igate? Do you have a TNC at home where you could monitor your
position directly on 2 meters?
Try http://map.aprs.net/KL7JG-7. The 8000 url doesn't seem to be
working all the time.

Scott,

It might just be the ticket for your application. My Rand McNally GPS
is connected to a Tigertronics TM1 tracker, with the DB9 on the tracker
supplying power to the GPS. The TM1 puts its +voltage supply on pin 9
when the appropriate jumper is installed, making a nice installation.
As purchased, the RM GPS gets power from pin 4 of the PS2 mouse port.

I cut off the cable just above the DB9 and PS2 connectors, leaving a
cable a little over six feet. The connections to the male DB9 connector
are:

RM GPS Wire	DB9 PIN
Yellow	2
White	3
Gound Braid	5
Red	9

In case you missed it from Shane McDaniels' post,

Rand McNally GPS power specs:

"Supply Voltage: 4.5~16 VDC, suitable for direct connection to
Automotive 12V supply. Current Consumption:
55mA type @ 12 VDC
125mA typ @ 5 VDC
Regards,Kevin@Rand McNally"

Steve, N8MYA

I checked out the site referenced in the email:

Check out http://www.talon.co.nz/frames/gps1200.htm

An it does say 55ma. One question, and maybe this needs to be asked of the
vendor, I'll send an email, but the GPS also provides a voltage out for an
active antenna.   Is that 55ma with the active antenna causing a drain, or
without. I'll let you know what I find out.

Talon says the current draw is 55ma without the antenna. Their antennas
draw about 25ma at 3.3 volts, so that would have to be added in.

The GPS they sell is OEM, so it is only available in batches of 100. I
asked what the 1201 was in a batch of 100, the price they quoted was $93.43
FOB. I can't compare the 1201 to the Garmin 25 because I have had no
expereince, but it seem $94 is not a bad price for a commercial OEM GPS, but
100 have to be purchased.

Rendered body type: text/plain

I am looking for a commercial GPS receiver in a box with "no" LCD display
need. All the unit needs is:
    * INPUT: 12VDC and GPS Antenna
    * OUTPUT: NMEA
I know I can purchase a GPS on a PC board and stick it in a Radio Shack
box, but I need a commercial unit. Got any ideas.

thanks in advance,
Rich Parry, W9IF

Garmin 35. They are $149.00, and you even get a MANUAL. Various mounting options from mag mount, suction cup, and trunk lid. NMEA output, with programmable baud rate and which NMEA sentences are actually sent. 1 PPS output. input voltage on the 35LP-HVS model is 6-40 volts. Mind draws about 70ma at 12 volts. It has dual serial ports. NMEA on one, binary on the other. Differential ready. See http://www.garmin.com for more info, and you can download the manual from that site. They also have a model called the 35PC which has a DB9 serial connector and car 12volt outlet connector. Can be ordered from Garmin direct. Call their 800 number and ask for the Aviation desk. Brent KH2Z

We had a local here with a shorted TNC cable and was key down for over 8 continuous hours at full power with a 202 on a base station antenna and power supply. Testament to the durability of the 202 that is still reported to still be in packet service. Wonderful practice exercise with the DF equipment, too.

Subject: [htaprs] HTX-202

I opened the newly acquired 202 today as a result of noticing that the mic and speaker are plug and socketed onto a pc board inside.

What I found is what appears to be enough room to fit a MIM module and wire it directly to the 202 inside, and possible route the GPS cable (GPS135) through the unused speaker jack.

Radio looks well built, well heat sunk on the TX side.

Cheers, Adrian

> D7
> how do I adjust squelch

Function - SQL, then dial the amount of squelch you want with either the
channel dial at the top of the radio, or with the up down buttons on the
rocker, then hit Function or OK (right button on rocker). Function button
is upper right, white "F" on purple circle. SQL on left of radio, bottom of
the two smaller two buttons.

> and how do I scan??

Press and hold either the VFO or MR button to scan either the VFO or
memories respectively.

> on a trip without my manual

http://216.98.255.24/Amateur/Instruction%20Manuals/THD7A.pdf for the manual.

It depends on what you want it for. If you want a rugged unit, JRC makes two very nice sensors at a
reasonable price. One has a built-in DGPS receiver, the other doesn't. I'm not sure of the latest
prices, but I bought the one with DGPS for about $500 a couple of years ago. I suspect that the simpler
 unit is half that.

Ok so now I have a tracker box going..   this has been an adenture I got all
my goodies from AES and I had no Idea what I was doing. I did alot of
guessing to how everything went together and set everything up..   (lucky
for me I had good guesses)   My biggest problem came to when I started to
program my tnc. Yes there are alot of web pages out there about APRS but I
still had trouble finding something that just explained everything from
start to finish from what to type and why you are typeing it. Lucky for me
I know a few guys in my area that are into APRS so I made some phone calls
and started a icq chat with one of my friends and he told me what to type..
So what I am looking for if somebody knows of it is a web page that has
everything or some type of a book or something that just tells all about
aprs or are there some documents available?   Thanx for all your help and
suggestions that you have already given me

Rendered body type: text/plain

Kenwood digital radio/TNC remote control,

Tonight, I discovered how to switch the control port between the
radio and the internal TNC so that my APRStk program can now both
auto-tune the doppler and route the downlinked packets DURING the pass
through the radio's single serial port. Thus, PACSAT Receive-only
stations can be assembled with nothing but a PC and the Kenwood HT on a
20 inch whip antenna.

I have been using a 3/4 wave vertical (20.2") on my THD7 and can receive
the downlink from any of the (working) pacsats while they are above 20
deg...(the antenna has over 7 dBi gain up at 40 deg or so on 435) and
still works as a 1/4 wave whip at 2m too.).

So, next version of APRStk will be able to tune the radio to the right
satellite and tune for doppler. Then just hooking the output to a TELNET
port can combine/share the downlink with other similar stations and the
world.

Then all we need is 5 more such sites and we have the whole USA covered.
Every packet from the satellite gets collected... and shared via the
TELNET links between the sites...

To see what we can do with this for a mobile amateur radio:

  http://web.usna.navy.mil/~bruninga/astars.html

de WB4APR, Bob

Yes, this works well in your car. But if you put 50 feet of coax between
the antenna and the HT in your shack, then you just lost 3 dB and should
add a preamp...(at the antenna).

Thanks for all the nice comments on my tracker unit and GPS mod.
Some have asked me for more details, so I have added some right on the
pictures.
My mods are simple, didn't even have to disconnect the cable! Just remove
it from the "mouse" case and screw it down in the new box. No soldering
required.

http://www.crsinternet.com/users/sdaniels/Tracker.html

And for the legel eagles out there, I'm sorry to say, I had to add a
disclaimer too.

Way cool! This might be a way to automatically switch back and forth
between packet and APRS operation. Care to share your discovery with us?

Better yet, a program that knows where the Satellites are, what frequency
they are on, and switches between them so we have a seamless data stream!
now all we need are more Satellites and better programs!

Dwight -

This is a SUPER idea! What a neat way to overcome the issue of limited access time to satellite fly-overs.

This is the sort of marriage between computers and amateur radio that I think will propel the interest in amateur radio to those who are not strictly out for the thrill of DX on HF.

To think we could program a way to seamlessly network all the packet birds so that you could queue traffic and wait for the next bird to fly over, use that satellite to digi the traffic to another Earth station with routing info, just like packet BBS's. Store it there until the next bird flies over and shoot it up for space shot #2, and so on.

The big missing link has probably been the lack of a PC tunable receiver to follow Doppler shift as the bird makes its pass. But with Bob's discovery about how to do it with Kenwood rigs, maybe we've overcome the last big hurdle!

Yep, Jim Gill is adding it to his web page, but it is simply TC 1 and TC 0 using UPPERCAASE... BUT it takes alomst 4 seconds for the TNC to initilize when turned on... :-(Gonna miss some data...

64. [htaprs] D700 hands-off tuning

From: "Jim Gill" <jimgill@ix.netcom.com>
Date: Thu, 3 Feb 2000 16:22:38 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64310-2000.02.03-16.20.19--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here's a followup to Bob B's posting about auto-tune on D700's -

I have to thank BOB B for finding the Missing Link - The Golden Nugget.... how to change to remote control mode when in the TNC PACKET mode!!! This is the key to making that fabulous all-in-one satellite ground station with total remote control ability.

Your serial port on your computer must be 9600,n,8,1. First, enter AI 1 to get the radio to be in "Command Echo" mode when in radio remote control mode. That way you can see the LIST data and so forth coming back to you while you are in APRS mode. This would be handy for an "ALL IN ONE"

software program that did memory control, freq change, packet sending and monitoring, APRS sending and monitoring, etc. "The Works". The following table looks best in fixed width.

```
  TNC         TO GO          KEY
IN MODE     TO MODE        STROKE
---------------------------------
 OFF          APRS          TNC 1
 OFF          PACKET        TNC 2 then TC 0

 APRS         OFF           TNC 0
 APRS         PACKET        TNC 2 then TC 0

 PACKET       OFF           TC 1 then TNC 0
 PACKET       APRS          TC 1 then TNC 1
```

Once in PACKET mode at any time, you may need to enter HB 1200 or HB 9600 to set the proper packet speed after switching modes. To switch speed while in APRS mode, use PKSA 0 for 1200, PKSA 1 for 9600.

I'll update my web page as soon as I can (no, really!) to include this.

Thanks BOB!!!!

Yep, read all about it at http://web.usna.navy.mil/~bruninga/astars.html

And tune in a pacsat with your THD7 or TMD700 during the next pass. EVEN from your mobile! For now, there is no data of use to us. But if we show that we can receive it with just the HT/LAPTOP or MOBILE, then it shouldnt be long till we get some APRS data...

It depends on what you want it for. If you want a rugged unit, JRC makes
two very nice sensors at a reasonable price. One has a built-in DGPS
receiver, the other doesn't. I'm not sure of the latest prices, but I
bought the one with DGPS for about $500 a couple of years ago. I suspect
that the simpler unit is half that.

 A number of years ago I had an Node with an IC3AT feeding a Mirage 220 MHz
brick go key down for almost a full 24 hours ... quite impressive as well.

Hi all,

Zones.Com just announced new pricing on Palm products. The Palm IIIx is now
just $229.

The IIIe is $149, but I don't know if that will work for our purposes.

Thought folks might like to know.

PC tunable satellite rigs have been around. However, not many guys want to
spend the $$$ to dedicate them to the topic discussed. The TH-D7A is a
great way to do that at a reasonable price. Unfortunately, you can only RX
the birds with it. But you could use the TM-D700A.

Good ideas nonetheless.

ok here is my problem I switched my kpc3+ to using the extra serial port
feature in the new firmware.   (which I would assume is on the unit since
the instructions came with it and it is a brand new unit)   and now my
tracker box is sending out a signal but it is not updating my location it is
only updating the old data.   any ideas? or help would be appreciated.
Also just to confirm I am using a lowrance GPs unit.   Which pins should be
connected for the Nmea to the extra serial port on the kpc3+ ?

Thanx

JEff

I wish to correct or clarify an important point regarding my TMD700 TNC
switching chart below. For example, if you wish to switch out of PACKET
mode only to quickly **re-tune** the radio, then return to using the TNC in
PACKET mode, you will not have to force the radio to re-intialize its TNC.
It is not necessary to further enter TNC x to drop the tnc out of packet
mode unless you truly want to take the TNC to APRS or OFF.

If I am receiving at 436.xxx (whatever) on the right band, in packet mode,
entering TC 1 drops me into a mode that has direct control of changing
frequency, etc without fully being in "APRS" mode. I quickly change my
frequency (using commands that I will post on my web site soon) then I enter
TC 0 to jump right pack into full packet mode. I haven't made the TNC
re-intialize, and I go right back into receiving data, where the only delay
has been the time needed for the radio to change the freq.

I hope this is clear; there is a distinction between what TC x and TNC x
does (as Bob noted in an earlier post, indirectly). I will update my web
pages with this when I can. Although TNC x is case-insensitive, TC x must
be uppercase (where x is simply 0 1 or 2 as in the chart).

As always, questions to the list or to me direct. Thanks.

Rendered body type: text/plain

And in addition to www.netcom.com/~jimgill/tmd700a.htm , I found some more
"must-have" remote control info while in APRS mode:

DTX 0   manual packet tx

DTX 1   PTT packet tx
DTX 2   AUTO packet tx

BCN 0 turns off beaconing if on AUTO
BCN 1 either turns on beaconing if in AUTO
or
BCN 1 **sends a beacon when in manual mode!** then returns to BCN 0.

Fabulous stuff for your remote control software projects. Still have the
problem though of DCD sense to figure out when in automatic mode. More on
that later.

Jim N0RMO

this stuff is going to my web pages as I get the time.

Sure, TC 0 and TC 1 switches the serial port between radio control and
TNC...

Yeah, and the all-mode sat rigs are not especially portable either.

> The TH-D7A is a great way to do that at a reasonable price. Unfortunately,
> you can only RX the birds with it.

Well, given the control capability through the data port, couldn't
software on a laptop Rx a packet, drop into control mode, switch the
data band, pop back into TNC packet mode, then then Tx the ACK packet?
It's a little sloppy, but if the TNC needn't be initialized each time,
you should be able to change the data band fairly rapidly. Just a
thought...

My testing yesterday still forced a TNC reset when going back to TNC mode.
I do TC 1 then sendt new freq, then send TC 0, but the TNC does a double
reset each time...? Ideas?

Margaret and I are planning a trip to Scotland, including the Isle of Skye,
and England, including Hereford, in the spring. What do I need to know
about repeater use there? Is the North American TH-D7A model incompatible
with UK repeater standards? If so, can I modify the rig? What is the APRS
frequency in the UK? Is most 2-m and 70-cm FM activity in the UK on
repeaters or simplex? Thanks for your help.

81. [htaprs] Satellie tracking and Radio control

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 4 Feb 2000 17:53:27 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64496-2000.02.04-16.51.49--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRStk is a beta program which added satellite tracking to APRSdos. Now
it can control the Kenwood radio too!
You can use it to monitor your local 2m APRS activity but it will QSY the
radio and switch to 9600 baud whenever a satellite is in view, and will
then auto-tune to track doppler. (i hope) I have found that the radio will
copy the satellites on just a 20 inch whip antenna when the birds are
above 20 deg. See http://web.usna.navy.mil/~bruninga/antsmobl.gif for an
antenna profile

Details:
1) APRStk is bleeding edge experimental. It aint perfect yet.... But if
you already have APRSdos, then APRStk simply runs in place of it..

2) New file name is ASTK-EXE.ZIP and it includes all the APRStk UNIQUE
   files to give you APRStk capability in an existing APRSdos system.

3) Hit F1-Help to see the APRStk unique condensed help info while running.

4) New commands are INPUT-MY-FREQ to directly enter a radio freq. Just
   to verify it works. Any FREQ above 400 will set HB=9600. Setting
   a 2m freq will set 1200 baud for now.. YES, between passes it can
   QSY the radio back to 144.39! (manually or by faking a GEOSYNC
   set of keps for a fake satelite in the table on 144.39)

5) To auto-tune, APRStk will us the table of FREQS and minimum elevations
   in the SYSTEM\SATFREQS.SYS file. If the satellite is above the minimum
   elevation AND the satellite has been marked for Tracking (T) on the
   P-LIST, then it will QSY the radio to that freq +/- doppler. It
   will sample doppler and retune the radio every 15 secs or so...

6) If two sats meet the track criteria, then only the later one in the
   list will be tracked. You can view the file with the LIST-FREQS
   command.

7) There is no antenna control, just doppler tracking since it assumes you
   are using an OMNI antenna. Still my system hears all sats above 20 deg
   on my THD7. This is the reason for the relatively HIGH threshold
   angles of 10 degrees in the freq table. I hope to have a gain plot
   by this evening. comparing the 1/4, 5/8 and 3/4 antennas.

8) WIth a little more integration, this will be on my TELNET port.
   Then those ports will show the 9600 baud downlinks from ANY satellite
   in view above 20 deg in Annapolis. All we need are a few more such
   automated groundstations linked by the internet.

Again, this is just experimenteal. It real power will be gained when
it is added into WinAPRS or APRS+SA, then we have ASTARS for real...
because of their built-in IGATE capability...

See for overall ASTARS: http://web.usna.navy.mil/~bruninga/astars.html

Is there anyway to get the TH-D7A to default to 9600 baud
on power-up? That is, without using a computer to do it every
time. If it is possible to use a computer to configure the unit
so that the default for power-up could be changed, this would
solve my current problem.

Done. APRStk now does that. It will QSY the radio to whichever satellite
is in view and will QSY for doppler. One thing I left out was an
automatic QSY back to 144.39. But you can fake it by inventing a
Geosynchronus entry in the satelite table and give it the freq of 144.39!

But then on 144.39 it fills up the lists so fast, that if you did capture
anythign from the satellites, it is quickly lost... Unless you set
CONTROL-FILTER-LIMIT to only one hop staions...

No real applications though until we get some cross country travelers with
D700's on the air...

86. [htaprs] APRStk QSY to 144.39

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 5 Feb 2000 11:46:37 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64597-2000.02.05-10.44.45--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For fun, if you want your HT to QSY to terrestrial APRS on 144.39 between
passes, insert a fake GEO satellite at the top of the SATFREQS.SYS file as
follows: (column positions must match)

```
SAT  CALL     UPLINK                 DONWLINK             MODE
---- -------  ---------------------  -------------------  -------------
APRS          144.39                 144.39          FM   Terrestrial
AO10          435.03 -435.18    LSB  145.975-145.825 USB  Mode B Analog
RS13          145.96 -145.99    LSB   29.46 - 29.50  USB  Mode A Analog
```

And inset the following KEPS in the LEO.ORB file:

```
Satellite:      APRS
Catalog number: 09099
Epoch time:     99001.0
Element set:
Inclination:     0
RA of node:      0
Eccentricity:    0
Arg of Perigee:  0
Mean Anomaly:    0
Mean Motion:     1.00265
Decay Rate:      0
Epoch Rev:       0
Checksum:        0
```

This should do it. To enable QSY to any satellite, hook it on the P-LIST

and indicate the usual TRACK (T).

Now, I do not know how well this will work during a pass. The code to
resolve conflicts when two birds are in view at the same time is not well
done nor tested. Hopefully , it will take the later one in the list.
Worst case is it will toggle back and forth every 15 seconds or so.. :-(

I cant fix it or test it till monday, because I left my HT at work hooked
to a TELNET site to auto track/tune all the PACSATS.... over the weekend.
Also, remember that APRStk will not try to talk to the radio unless you
indicated THD7/D700 as the TNC type when you did the start up
configuration...

Note to other D7/D700 users: there is a difference in the way the two radios
accept "radio control" commands. When using the THD7 TNC in PACKET mode in
CONVERSE mode, you apparently can enter TC 1 to drop down to radio control
mode, enter your frequency change, then enter TC 0 to come back to PACKET
mode. The TNC re-inits when you come back to packet mode.

On the D700, if in PACKET mode in CONVERSE mode, you ***must*** send a
ctrl-c to drop to the cmd: prompt, then you can

TC 1   to go to radio control mode
change freq
TC 0   to go back to packet mode then
CONV or K to get back into packet converse mode.
The TNC does *not* re-init.

Ther are subtle *important* differences between the two radios even though
they behave mostly the same. I am continuing to discover and document these
diff's with Bob B and on my web page.

Enjoy!

Just setting here looking at the latest issue of Newport's roadSTAR maganize
(free magazine for truckers) February 2000 issue and on page 36-37 pops out
the D700. This magazine can be found for free and is at most truck stops
near the drivers lounges or by the phones. Some other interesting devices
that are dash mounted.   Might be able to find this magazine printed on the
internet. www.roadstaronline.com

Cool toys for 18 wheelers and the four wheelers too.

Rendered body type: text/plain

Am I correct that the only way to insert a blank space in a msg on
the D700 is by using the character key? This certainly seems unduly
difficult for a character that gets used so frequently. The only way
I've been able to do it is to:
        1.press the tuning knob to move to the next space
        2.press the character key to insert a blank
        3.press the tuning knob again to move to the first space of the
next word
        4.press the character key again to get back to alpha (abc) mode

    There must (should) be a simpler way. I could find nothing in the
manual.

Don't use the tuning knob to advance, use the soft arrow keys on the bottom
of the display. Then you can use fingers on the right hand, too. Actually,
I thought having the space be the default character of the character key
was rather nice, a lot easier than finding it on the D7A.

I wanna thank everyone who answered my request for help.   I finally
figured out what was wrong after spending 2 sleepless nights and reading
alot of stuff..   What I realized was that when I set the second port on the
kpc3+ that is new with the new firmware that I did not have to intialize
the gps before using my tracker box.   My guess is that because I did that
the tnc was back to looking for the gps data on the other port. or
something to that affect..   or atleast this is my guess.   All I can say is
now it works and I am happy :)

Use the MICROPHONE to enter messages. The "0" key is the space.

A is cursor right
B is cursor left
C is delete
D is OK

Makes enter messages MUCH easier.

100. [htaprs] TH-D7A and 9600 baud

From: Jon Ogden <jono@enteract.com>
Date: Sun, 06 Feb 2000 01:23:16 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64689-2000.02.06-01.18.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

I've had people tell me this, but now I have verified it.

The TH-D7A does not really work that well for 9600 baud. The reason is that
it takes the radio too long to switch between TX and RX. So the station you
connect to has already sent its data or acknowledgement back by the time the
HT gets into receive.

A local packet expert told me this, but I didn't necessarily believe him
until I tried it. He was right. Connecting to a local packet node 2 blocks
away is interminably slow as the HT doesn't hear all the packets from the
node as it takes too long to switch from TX to RX.

>From what I understand digipeating through another station can alleviate it
since the digipeater doesn't send acks back but the final station you
connect to does. So by the time you get back to the RX frequency the digi
has done its thing.

I am curious if the TM-D700A is any better.

I am also curious on other people's 9600 baud experiences.

Rendered body type: text/plain

Now that the Palm IIIx's have come down in price, I'm thinking of getting one. Could someone tell me what accessories I would need to use it for PalmAPRS...also, what accessory would I need simply to have it talk to a TNC to program it properly.

You guessed it...I've got a pico that periodically loses its settings if disconnected from power, so I have to program it in the car if I want it to keep in gps mode!

I know little or nothing about the Palm devices, so I need the nuts and bolts of what to buy.

Initially I just want to have the palm talk as a terminal to my tncs. Then I want to pursue the pocket aprs use. Any help would be much appreciated before the cheap Palm IIIx's are out of stock. 73

OR   http://web.usna.navy.mil/~bruninga/astars.html

Sorry folks. I am at the WEB site and even I cannot access it. ALl the
computers went down sometime yesterday, and no one here to bring the
system back up apparently. Expect it to be back up on Monday.

But I have fixed the problem in APRStk.EXE limiting operation to the THD7
only. Now it should work with the TMD700 also. And I edited in the pseudo
GEO sat for 144.39 so that the radio should go back to terrestrial APRS
between passes.

Watch for STENSAT deployment today. STENSAT is also in the list and
should also be auto-tuned on 2 meters... Since STENSAT is not yet deployed
I used the NASA object number for JAWS. Once STENSAT gets its own #, then
you will have to edit that in... since all updates are based on OBJ#.

Again, this is BETA software. Feedback welcomed. Grievances expected...

Hello all. Regarding the recent posts of sma connectors shorting out or no longer
making the connection. There exist computer db25-15-9 port protectors which are
simply m-f adapter, is anyone aware of a similar adapter sma male to female which
would permit us to leave it on the radio and when it goes bad, replace it with
another, thus lessening the wear and tear on the onboard female. Also, anyone
know where to find the 3.5mm dc connector in a 90 degree mode?

108. [htaprs] RE TH-D7 AND 9600 BAUD

From: John Blowsky <kb2scs@worldnet.att.net>
Date: Sun, 06 Feb 2000 08:36:19 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-64940-2000.02.07-16.58.51--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Jon
  I had entirely different experience. I Connected to a 9600 baud
Flexnet node
that is about 25 miles from my house. I did this with an outside ant.
and 5 watts.
Any how the connection worked flawlessly. In fact I cannot wait to get
my d700 so I can
do this all the time.

Interesting. Perhaps the node is set up to delay transmitting for a bit
after it receives data. A longer TXD delay would certainly help a lot. If
it is set too short, the TH-D7A does have problems receiving properly.

Rendered body type: text/plain

The Kenwood website provides a free D700A control program for
programming. They say it runs under Windows 95/98, I wonder if anyone has
tried it on NT. I could install it and find out pretty easy, but rather not
experiment with the Registry (scary stuff).

Alternatively, are there any NT users out there doing anything clever to
program the D700?

thanks,
Rich Parry, W9IF

Rendered body type: text/plain

When I turn my car OFF with the D700 is ON and subsequently start the car again, sometimes the D700 turns ON automatically (as it should) and sometimes I have to manually turn it ON. I want the D700 to remember the state it was in when the car was turned off. This is important in a tracker application where you don't want to have to remember to turn the D700 on when you turn the car on. Is there some hidden menu item I missed (BTW, my APO is OFF).

thanks,

Rich Parry, W9IF

Richard,

I'm replacing a failed hard drive on a new barebones system of mine, and will be reinstalling NT4W on it. This is a 15Gb drive, so I'll be using Partition Magic to set up separate partitions for NT4S and NT4W with NTFS, 98SE/FAT32, and one for a future first-time (for me) install of Linux.

The long and short of it is, I seem to remember trying the KW software on NT4W before I crashed, will try again and let you know what happens (the KW software was not the reason for the drive failure).

Also a major previous impression of the KW software was that the channels do not retain their sort order when you re-open a *.700 file, so you either have to re-sort before you upload to the radio, or elect not to use their sorting at all.

Give me a day or so and I'll have some further answers for the sig unless someone beats me to it.

> Alternatively, are there any NT users out there doing anything clever to
> program the D700?

Been doing a lot of experimenting with programming "manually" through the port by discovering and documenting control codes. Also the radio works great with the 9600baud UOsats. Look at my web page at http://www.netcom.com/~jimgill/tmd700a.htm for the work I've done so far.

> NT4W
> Give me a day or so and I'll have some further answers

I am able to run Kenwood's Mcp_d700.exe in NT4 Workstation from a shared
directory on a Windows98 box over my LAN. It appears that this program uses
default windows dialog boxes and controls, since it does not install or need
any special or additional dll's or supplemental files. I'm able to open
from disk, modify, and save to disk any *.700 files on the NT box, while
running the software over the LAN as indicated.

Since my radio is actually out in the van, and I don't feel like dragging it
inside at this late hour, I haven't actually tried to connect to the rig
over a serial port in NT4 Workstation. When I get a chance I'll let you
know if there are any comport issues in NT by actually trying it with the
radio.

Hi Rich

Are you using the PM settings to memorize a favorite configuration?

The D700 has five of them and I set one for just packet use, i.e.,
changing the menu so the Packet Menu is on top and setting the TNC on and
setting the other side of the radio to my normal repeater freq.   I also
have a PM set so the radio is set up like a conventional dual band voice
radio.   It sounds like this is what you need for your setup.

I won't go into the procedure since it's in the book but you might have
missed knowing that feature was available.

Richard,

I have a PM memory set up for just this purpose! I have my normal one set
to send a packet every 2 minutes. When I park the car, I hit the PM button
and the proper PM memory. This switches my display to the dimmest setting
possible and also changes my beaconing time to once every 30 minutes. Some
people prefer to add position ambiguity to this state as well.

I don't like the idea of turning a radio this heavily software controlled on
and off via the power line. Frankly, that scares me. Bad things can happen
with voltage glitches, etc.

When you get back in the care, re-select the PM that you want for mobile use
and off you go!

This way you still beacon when parked.

I have discovered a program that I can scan in any map and convert it to a palm format. This has done wonders for me and it is free for all to use. Check out the site Listed below:

http://www.precisionnav.com/

I have scanned in the maps of the three counties that we work in for ARES here in the local area and they all work fine for pocket HTAPRS in my palm IIIe. I am going to try the topo maps next and see how they do in the palmpilot next.

>
>
> jeff

try this:

 >>this is a simple, easy to build, circuit designed to
automatically turn on your dumb mobile tracker *after* you start
your vehicle engine (thereby eliminating voltage spikes
that may cause TNC or Radio memory dump during startup)
AND this circuit is designed to keep your vehicle icon
"on the map" for the entire time your vehicle is off and
parked.

(kpc-3 owners note the following .... i have the BLT command set at
a 10 second delayed start so as to get at least 2 reports out during the 2
minute
'window' the tracker is on while parked)

BLT 1 EVERY 00:02:00 START 00:00:10

this works excellent if you like to use www.aprs.net at work so make sure
your car is still in the parking lot.... or your daughter is 'still' at the
library
after 3 hours....or your wife is 'still' at work....etc..

it eliminates the 'old excessive beaconing'
problem encurred by just leaving the tracker on and
running while parked. beaconing over and over and over
and clogging up the frequency......

(actual rate is about 3 position beacons xmited per hour)

this will work with all trackers including kpc-3's,
paccomms, mfj's, mic-e's etc.

first, many thanks to gene ke6hxi for his assistance
on this project and for pointing out to me that a common
"headlight" relay is actually an electronically controlled
"A/B" switch. The headlight relay is actually the 'heart'
of this setup.

              *                *
              ******************
```

Notes:_____

HeadLight Relay: Common headlight relay
found anywhere. (Potter & Brumfield type)
(any autoparts store etc.)
actually you might find one at a junk yard with
the socket connecter attached with the wiring harness
for a good price...

TDR#1 = Time Delay Relay (Delay On Make)
0 to 10 minutes (adjustable)
part# HRDM123 SSAC Inc.

TDR#2 = Time Delay Relay (Recycle)
16 min off / 2 min on
(off time first)
part# HRDR112MB16M SSAC Inc.

KPC-3 = BLT 1 EVERY 00:01:00 START 00:00:10

This command insures a beacon or 2
during the 2 minute 'window' the
TDR has the tnc/radio on while parked.

Special Satellite tracking event on AO27

Steve Willey, KD7GXO and Eric Horst, KA7OBN requested APRS assistance in tracking their vehicle starting Friday from Seattle to north of the Arctic circle, Prudoe Bay while participating in the ALCAN2000 Alaska Rally from 11 to 19 Feb. THis is a grueling event in the dark cold of the Arctic WInter.

In the short time available, the best idea we could come up with was to suggest using their THD7 Kenwood APRS hand talkies via AO27. Since this is a timed event, they will not be able to use handheld beams while moving in the -50 deg weather, so they will only be transmitting with 5w into a 2m vehicle whip and probably only once every 30 seconds.

We ask all Satellite capable stations in the Pacific Northwest to listen for them (and/or their packets) during the daytime AO27 passes from the 11th to the 19th. Particularly, the Western passes.

RECOMMENDATIONS: We are NOT asking for dedicated time on AO27. It is a popular bird. All we ask is that if you do hear a packet burst, then set your watch and try to announce exactly when the next 30 second packet might be, and clear that 1 second time slot for their weak signal.

1) NO ONE else should transmit packets AT ALL. Any other packets will totally confuse all the rest of us listening.

2) Set PASSALL ON, so that you will capture even garbled packets. We can try to post-process these packets later to figure out where they are and how they are doing. Post any packets received. Remember they will look like 9 bytes or so of gyberish which is the APRS Mic-E compressed mode. so save ALL packets no matter what they look like.

3) After about the 13th, they will be so far north and west, that only the last 2 passes of the morning for Seattle will have them in the footprint. SO point your beam fixed to the northwest and listen. Also, those northwestern passes should see much less USA QRM.

The downlink of AO27 starts on 436.805 at the beginning of the pass and moves down to 436.785 by the end. A BEAM is required. These will be standard 1200 baud AX.25 FM packets. We hope this test will give us useful data on the viability of wilderness communications via amateur satellite. To learn more, see:

http://web.usna.navy.mil/~bruninga/astars.html

Here are some estimated pass ties for the first 5 days:

DATE	PST	UTC	Comments
11th	0930	1730	
	1105	1905	Best (further from the USA)
12th	1045	1845	
	1220	2020	Best (Further from the USA)
13th	1015	1815	
	1155	1955	Best (Further from teh USA)
14th	0950	1750	

```
      1125 1925 Best Seattle users beam NW

15th  1058 1858 Best (half way between Fairbanks and Seattle)
      1235 2035      Seattle users beam NW

The western passes of the two are generally better, since they will have
fewer USA stations on the bird at the same time.  Towards the 15th, then I
selected passes over alaska and so Seattle users should just park their
beams toward the NW and only concentrate on listening to those western
passes...

I do not see Kenwoods TH-D7 software on Kenwoods site. Whats up?

looking at:
ftp://216.98.255.24/SOFTWARE/

Thanks for any info
Walter

Walter -

Good question. Maybe they're posting an update? Probably not...

> Scott Shaw, KG4FYW

Scott and all,

The site contains the program for the compass as well as the mapsync
software. You have to download both to the hard drive but you have the
option of not installing the compass software to the pilot. I can forward
the file to anyone who needs it. I have written the site owner and asked
permission to forward it ot others on the list.

If there are any other problems I can be reached here.

Rendered body type: text/plain

I have been asked if either scanned in maps or saved maps will work on
mapsync, the answer is both. The best source of maps I found is mapquest
http://wwwmapwuest.com   for all my maps that I don't have if there is any
problems I can be reached here.

Thanks to all

129. [htaprs] APRStk Satellite Tracking

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 9 Feb 2000 13:41:57 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-65204-2000.02.09-12.40.08--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRStk has satellite tracking embedded into APRSdos. It is the first
satellite program to auto-tune your Kenwood D7 or D700 for automatic
downlink capture.   A new version has been posted which incorporates these
improvements:

* Adds ISS and MIR and the recent OPAL and STENSAT to the keps
* Autotunes the Kenwood radios to the downlinks.
* Converts TLM packets to HEX so binary data doesn't mess up screens
* Adds NAVSPASUR 217 MHz radar Fence to maps so you can listen for
  radar pings when satellites cross the line...!
* APRStk.ZIP is now posted which incluldes a full-up APRSdos INSTALL
  Please use PKUNZIP -dn or WinZIP for a full install.
* ASTK-EXE.ZIP is an upgrade for existing APRSdos users. Also
  use PKUNZIP -dn to get everything.

Just run APRStk, set the squelch on your D7 or D700 radio connected to a
20" whip antenna that can see the sky with minimum coax loss, and the rest
is magic! (Downlink reception ONLY.) You will be amazed how many
satellites are flying overhead all the time..

  For more info: http://web.usna.navy.mil/~bruninga/astars.html
  Complete Download: ftp://tapr.org/aprssig/dosstuff/APRSdos/aprstk.zip
  For APRSdos users: ftp://tapr.org/aprssig/dosstuff/APRSdos/astk-exe.zip

This is a downlink monitoring application only. It is not a full-up
satellite station control program. But here are the satellites you will
hear:

UO22
KO23 (when it is working. not today)
KO25
TO31
AO27 (voice)
SO35 (when in voice mode)
OPAL (a weak brief burst once every 10 seconds)
STENSAT if it deploys properly

AO16,LO19,IO26 are Authoruized for APRS, but require UHF SSB radios and
               PSK modems for the downlink.

de WB4APR, Bob

Is anyone else having trouble reading the "screen shots" of the radio
displays in the manual? On my computer the display shots are largely
unreadable at any resolution or zoom range... they are garbled and
distorted, not unlike what a *highly* compressed JPG will do to line
drawings. The actual text in the manual pages and any of their line drawings
or diagram graphics are fine.

The software's been of the web for several weeks. I formatted my hard
drive, and was pretty bummed that I couldn't find it.   Perhaps they pulled
it because someone on this SIG was complaining about it. I wish Kenwood
would list a reason for why it was pulled. BTW, I found a copy hidden on
another one of my systems and can email it to someone if they require it.

Rendered body type: text/plain

Peter, I'm not sure what you mean by "working". I can take a *.gif map, drag
and drop it on the program icon and it does create the file in the install
directory. I have not loaded the map onto the palm (nor the pocketAPRS
program).

I don't have a tnc to connect the palm to at this point, but I was thinking
I could evaluate how well the maps work if I installed pocketAPRS and the
maps and just displayed them and zoomed around a bit.

Does "working" mean, a successful conversion and placed in the palm software
install directory, or does "working" mean, when you try to use the map on
the palm with pocketAPRS it doesn't load the map?

I'll tell ya what really amazes me, if it is true:

You can take a map (like I did from mapblast which shows the western 2/3 of
Iowa), save it as a *.gif picture from Internet Explorer, copy it to the
desktop and drag/drop it on mapsynch and end up with a usable map for
pocketAPRS. Is it really that simple?

All other mapping programs for any version of APRS appear to be nightmares.
GEO files required, tagging the corners for long/lat....is none of this
required for the palm? That would be miraculous and I'm having a hard time
wrapping my head around the apparent simplicity of it all. What is wrong in
my thinking?

I would appreciate it if anyone would clear this up for me, it just seems
too good to be true. If true, then we have access to any map we could ever
want on the internet, or from a scanner and its a simple 1,2,3 and it
works....surely you jest?

1 = download the image and if required convert it to *.gif format.
2 = drag/drop image on mapsynch
3 = hotsynch the map file to the palm.

I don't understand how it deals with "sizes" of images downloaded and keeps
things in "perspective", so that the icons that show up, actually show where
they are supposed to. perhaps the standards for maps in palm are so
stringently specified by the OS that the conversion program (mapsync)
adheres to the standard and converts accordingly, such that the scaling and
perspective are always maintained? Again, sounds too good to be true.

Please, anyone who knows anything about this, fill me in. TIA

Hi guys,

I too now am the proud owner.. I even have it mounted in the
car, and tracked myself somewhat around the neighborhood...

The question: Obviously you must leave the unit and the gps
running if you want to keep an eye on the car, but not at
the roving beacon rate of a couple minutes or three.. I
understand how to control or turn off the gps, but how have
you other owners set up the beacons? I don't see mention of
the phrase "CLEAR", but also I am a little slow in catching
on to the PM modes as far as changing the beacon rates.. If
the car was to be moved by a stranger, it would still be
beaconing the "parked" or last location!

While learning, I am as always, open to thoughts and
suggestions!!

Thanks for reading es 73!

The TH-D7A software (MCP-D7A) was a beta version. With most beta versions
a final release version usually follows. The final release version is the
PG-4W kit (CD + cable). Now that the PG-4W is out now, Kenwood pulled the
beta (courtesy) version off the FTP site. To my knowledge, I think Kenwood
is the only manufacturer that provides an FTP site for manuals, software
and other misc. help files.

Kenwood agrees with your comments and looking into getting a clearer copy
for the FTP site. Thanks for your comments. It takes just the right scan
resolution to get the line diagrams and text to be clean. There is always
a balance of file size vs. clean copy that has to be

considered. Evidently, Kenwood rushed to make this copy available to the
public. As soon as a better .pdf file is available we will repost it. Any
volunteers? :-)

Note: Kenwood the only manufacturer that provides this service as a
courtesy to our valued customers and customers to be!

Go! Kenwood!

Congrats, Robbie!

Glad I talked you into it! You aren't the guy running around here with
NOCALL are you? Hi Hi! Of course not. You and I talked about him! :-)

Anyhow, when I park the car, I generally leave the radio running. All of my
normal operating parameters are stored in Parameter Memory Slot #1. When in
that slot, every time I turn the radio on it goes to those defaults. I can
screw around with frequencies, mode of operation, etc. But when I turn the
radio on again, it is back to normal! (Note - To do this, you must turn the
"auto-update" function of the PM memories off!)

When I have the car parked, I have another set stored in PM2 that changes my
beacon rate from 2 minutes to 30 minutes and also dims the display so that
it looks "off."

It works well. Sure if someone "moved" your car, you'd only know where it
is every 30 minutes, but if I am going to be somewhere I am not usually at
(like a parking garage in downtown Chicago), I will just remove the
headpiece all together.

Congrats on the toy. Hope to see you on!

73,

Jon

For anyone looking for a Palm III to use for portable APRS let me know. I
don't get to use mine enough to justify keeping it.

I've upgraded it to the latest version OS, 3.3. I have the CD which came
with the unit plus an additional CD full of bonus shareware/freeware, most
of which you can find on the 'net. I also have a HotSync cable as well as
the docking cradle.

Asking $150 + shipping.

email me at n2iph@qsl.net
or call 914-734-5716 7am-7pm M-F.

Considering that Kenwood still has the software for the TS570 available (from
1996) on their ftp site, I think the missing software was just an oversight. In
fact, I thought the newer version of mcp-d7 was on the ftp site before the
disapearance. It has been very helpfull to me that Kenwood supplies this type of
information over the internet. I can say that it had a great deal to do with my
descision to purchase a Kenwood product. When I make a purchase like that, I
want to know more about the product than a one page add on the back of CQ
magazine. I just about read the manual from cover to cover before I purchased
the radio.

If you take a look in the TAPR aprs, or htaprs, sig archives of about a year
ago, Kenwood announced that the software was going to be on the site for a
limited time only. (Or something to that effect) You had your time, and a
year is awfully gracious, especially since the final version has been out
some time now, not to mention you get it and the cable free with the radio
now!!! If you can't find where Kenwood mentions the fact that the software
would not be on the site forever, I'll look for it and quote it to the list
again. But I shouldn't have to, I can remember it like it was yesterday,
then again, I got a good long term memory, can't say much for the short term
though.

Rendered body type: text/plain

Something that should be passed on to HTX-202 users. That radio has a built in TIMEOUT TIMER. From my memory it is in the mset and is item T0 . The nuber is the nuber of seconds the radio will allow a constant PTT before stopping the transmition. I have this feature turned on on all of my HTX radios and also my Kenwood TM-V7A. The only thing that surprised me about the feature was that the default setting for all the radios was disabled. I would have thought that a radio with thecfeature would at least had it enabled for the longest time period.

I opened the newly acquired 202 today as a result of noticing that the mic and speaker are plug and socketed onto a pc board inside.

What I found is what appears to be enough room to fit a MIM module and wire it directly to the 202 inside, and possible route the GPS cable (GPS135) through the unused speaker jack.

Radio looks well built, well heat sunk on the TX side.

Cheers, Adrian

When I used to work the 9600 satellites we left the receiver on the
receive frequency and the transmitter on another band and didn't have a
problem switching from RX to TX and back because it worked full duplex.
When I switched to terrestrial 9600 I didn't have that luxury so I had to
make sure that the TXDELAY on both stations was long enough (> 300 MS)
to ensure that the rig could switch back to receive in time.

Excellent information, thanks!

There are many 202's in operation here. They are often available at
dramatic low prices from the RShack outlet stores in the DFW area and at
HamCom. No one knew about the timeout timer. An obvious case of RTFM.

Cliff -

I would be happy to scan the manual, if you'll send me a copy of the paper manual. I don't own a D700, but generate technical documentation all the time.

The real question though, is why Kenwood's documentation department doesn't produce the PDF from the electronic source? Anybody with Adobe Acrobat can print to a PostScript file using the standard Windows PostScript printer driver, and then distill the file into a PDF document. Acrobat also installs menu options in popular publishing software to create the PDF directly.

This results in a much smaller PDF file. Graphic image quality is generally far better, with images stored as vector data (which is infinitely scalable). And text is stored as text, rather than the whole page being treated as a graphic image, which allows searching through the document for text matches and creating linked indexes.

148. [htaprs] TMD700A manuals no longer at kenwood.net

From: "Dennis Hudson, N2LBT" <n2lbt@n2lbt.com>
Date: Fri, 11 Feb 2000 12:34:44 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-65515-2000.02.11-11.33.05--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I think it would be a help to be more specific as to the complaints. The
main Instruction manual TMD700A.pdf was produced mostly correct. Only a few
graphics on page 84(90) in the "Optional Accessories" were a little fuzzy.
Perfectly fine though for the purpose. Otherwise it prints out perfect on a
HP LaserJet 4000N.

The flawed PDF file was the "Specialized Communications" supplement
TMD700A_SP_Comm.pdf. I'm not a PDF expert, but all the diagrams are showing
up as embedded graphics in the SP Comm. They don't show up as graphics in
the working TMD700A.PDF manual, rather they appear to be some sort of native
vector graphic. I imagine both manuals were done the same way, so possibly a
setting was in mistakenly changed when the SP_Comm manual was distilled to
PDF.

Kenwood has apparently pulled both manuals from the web site. If you did not
already get them they're gone. Maybe they could put the TMD700A.pdf back. I
have already placed the PDF back in a Pagemaker documnet and printed a
duplicate reduced size manual for my glove box.

I haven't yet looked to see what the max voltage power specification of the
202 is, but I accidentally ran mine at 24 volts last night for about 20
minutes. There doesn't appear to have been any damage. A very hearty radio.

Mike

Rendered body type: text/plain

Hi all. I wonder if anyone can help me with this.
I'm trying to write a simple program in Visual Basic
to make auto QSY on the D7 at specific time intervals.
Does anyone knows the "commands" that D7 accepts
from the PC serial port?
And if anyone can give me an example (just one line)
how i can send data via serial port using VB to D7 ?
Sorry for the questions but i've searched many books
and nothing about this......

Best 73s...... Fanis ....SV1BGM.........

The ALASKA Road Rallye is underway. Nothing heard so far via AO27,
but there is one more LOW pass for stations in Washington state and in
Anchorage... at 2040 UTC..

Is anyone else having problems with APRStk not tuning their THD7?
I have two reports, one from NJ and one from South Africa that it "dont
work". I have other reports that it works fine.

Other than making sure the TNC is in packet mode and Band B is enabled for
data. I dont now what else to suggest... Anyone else having problems?

156. [htaprs] D700 with APRS+

From: "George S. Pappayliou" <AA8MA@worldnet.att.net>
Date: Sat, 12 Feb 2000 15:38:32 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-65654-2000.02.12-14.38.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've got a D700 installed in my car and occassionally I would like
to run APRS+ on it. The rub is that my laptop has only one serial port
so Ican't run the gps into the laptop and then out to the D700.

    Since the D700 already has a jack for the output from my GPS I was
hoping that that jack was connected to the serial port on the D700 in
such a way that I could use the d700 to route the NMEA sentences to my
PC and get by with only one port. Does anyone know if this is possible?
How do I get APRS+ to look to the same port for both TNC and GPS data?

157. [htaprs] D700 problem

From: Jim Neely <jmneely@attglobal.net>
Date: Sat, 12 Feb 2000 20:45:49 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-65674-2000.02.12-20.43.07--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have a new D700 and have run into a packet problem.

I have a computer hooked up and can talk to the TNC. I am apparently
transmitting, but I haven't received a packet. I hear them, but don't
decode them. I tried to connect to myself through a digi and hear the digi
trying to connect, but time out.

The receive error count is high. I see the TNC response to commands, but
no received packets.

Yes, I'm in TNC mode. Any suggestions would be appreciated.

Thanks & 73...jn

Run the latest beta of APRS+SA, v1.99XU (XV to be posted either today or
tomorrow hopefully). Set the TNC file to INITTHD7.TNC, use the same for the
D7 or D700. Set the TNC port, Port 1, to "Mode 7". APRS+SA will now
receive GPS data from the TNC.

Message-ID: <LYR845-65779-2000.02.13-13.55.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Is the TH-D7E supposed to respond to APRS queries? Mine does not seem to. It stores ?APRSP and ?APRSS as normal messages without sending the relavent response of position beacon or status. The messages are given a status of M whatever that is? I can not find any refference to this in the manual. Maybe the TH-D7E does not have the full APRS implimentation that PC systems have? I don't know.

73, Simon.

Rendered body type: text/plain

No, the 'dual port' is for TNC's like the KAM etc that can receive data
on two different ports. In the case of the KAM this is HF and VHF.

Brent commented on the correct info for a Kenwood in an earlier post: Use
the "Mode7" mode on the Port 1 setup on the Main Parameters tab of the
setup menu. The GPS data is fed to the Kenwood and it outputs the GPS
data to the TNC at intervals as set in the InitTHd7.tnc file. That tnc
file must also be selected as the TNC configuration file on the setup
page.

Note that if you were using a dual port KAM as the tnc, you would select
the KAM.tnc setup file, check the dual port option and use 'Pico' as the
Mode. The Mode7 is for the Kenwood products.

Hope this helps.

How did you work 9600 baud birds with the TH-D7A??? Did you have two
radios?

Rendered body type: text/plain

I would suggest not repeating this. I looked at the schematic of the radio when I noticed that its output power was showing close to 7.5 Watts. The PA is powered direct of the D.C. jack no volted or even polarity protection. I have run one of mine for some time on 15 Volts with no problems. Just more output power.As I recall that is the manuals suggestted max Voltage. I would be concerned about running a high duty cycle transmit like this as the radio my not have good enough heat sinking.

James

Michael Jones wrote on 00-2-11 10:10:

I haven't yet looked to see what the max voltage power specification of the 202 is, but I accidentally ran mine at 24 volts last night for about 20 minutes. There doesn't appear to have been any damage. A very hearty radio.

Mike

> Something that should be passed on to HTX-202 users. That radio has a built in TIMEOUT TIMER. From my memory it is in the mset and is item T0 . The nuber is the nuber of seconds the radio will allow a constant PTT before stopping the transmition. I have this feature turned on on all of my HTX radios and also my Kenwood TM-V7A. The only thing that surprised me about the feature was that the default setting for all the radios was disabled. I would have thought that a radio with thecfeature would at least had it enabled for the longest time period.

165. [htaprs] Question about 700

From: "Peter J Anderson" <colohtaprsunit@co.freei.net>
Date: Sun, 13 Feb 2000 22:23:26 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-65857-2000.02.13-23.30.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does the 700 have the same setup as the D7A? That you can plug in the GPS
and the Computer to the rig or is it different? Any info can be mailed to
me directly to avoid clutter on the list.

Thanks

> Yes, I'm in TNC mode. Any suggestions would be appreciated.

How strong are the signals you are receiving? If they don't light up the
S-meter to full scale, you'll likely not decode them. The TNC's inside the
Kenwood radios are poopy when it comes to decoding weak packets. I have no
idea why as my KPC-3+ will decode packets that barely break the squelch.

Don't know if this helps or not.

i don't know why kenwood didn't include true DCD in their th-d7a and tm-d700a?
always find adjusting the squelch whereas before using a kpc-3 i could just
leave it wide open!

I hate to report that I have discovered a problem with my D700.

  Here is the failure mode:

   The APRS beacon is transmitting on the "B" radio. At the same time I key
the Mic to talk on the "A" radio, At this point all is well the packet data
goes out the "B" radio just fine. When it is finished transmitting the "A"
transmitter keys up (I still have the Mic key down) and I am talking into
the Mic. Users on the repeater tell me that all they heard was a dead
carrier. I have to wait until the transmitter is done on the "B" side then
key the "A" side to be heard. When you are driving it is not possible to
look at the radio to see if the "B" transmitter is active so many time I
transmit dead air.

  Any one else see this problem .

No, I have not seen a similar problem. I've been using the D700 for about a month now. I use channel-A as the data port, and frequent a phone repeater on channel-B. I have heard no complaints.

I have noticed that the radio appears to receive a lot of interference as compared to my old Radio Shack handled that it replaced. It either appears to have too wide an IF channel, poor selectivity, or some other problem. Perhaps it is just more sensitive than my old handheld, but I don't think this is the problem. I have an early model. My serial number has a lot of zeros with a 6 on the end. Anyone else have a similar experience.

I had some problems deciphering my owners manual. I sent several questions to Kenwood, and they never responded. I'll think twice before ordering another of their products. I'm hoping that Kenwood updated the manual and added more information about APRs operation, but I'll have to wait to see what they post.

I am making a cable to go to my palm pilot to the TNC unfortuneatly the
modem cable is no longer made :(so i am using the hot sync cable.   Is
anyone else doing this? I am not sure if I wired it correctly or not.
Does anyone have decently detailed instructions on how to wire it and what
the correct pin outs should be? (and maybe the colors of the wire... Also
how should I be looking at the plug that goes into the palm pilot.. ?

thanx

Jeff, this is well documented on the PocketAPRS page. You can however, if
you are in a rush, use a 9 pin null modem adapter. It can be found
everywhere, including Radio Shack.(I have been using a null modem adapter,
and have been for months. This allows me to continue to use the hot sync
cable as a hot sync cable for my second computer at home.)

http://www.pocketaprs.com/wiring.html

good luck

Dennis, N2LBT

172. [htaprs] Home stations not running "RELAY" alias????

From: "Jeffrey Thomas" <kd4evb@hotmail.com>
Date: Mon, 14 Feb 2000 15:14:25 PST
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-66015-2000.02.14-17.12.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Howdy all,

I've been noticing that the bulk of the home stations (at least in the
Cincinnati area) are not setup for a MYALAIS of RELAY. Maybe it's just me
or something I'm doing, but I don't think so.

I got to checking and noticed that my own WinAPRS setup doesn't set the
MYALIAS to RELAY unless I explicity tell it to do so. The documentation
that I've looked at so far gives the impression that the RELAY alias is
always set by default via the software, but it's not.

Digi coverage in my neck of the woods is okay for bases, but really spotty
for mobiles and D7 HT's. The situation is getting better, but we still have
a lot of coverage holes. Many of the home stations in the area have about
(some more, heh heh) the range of a lot of the digi's (most of our digi's

are really not that "wide" so to speak) and not having them setup for RELAY duties is a detriment to APRS ops in the area as they could fill in a lot of the coverage holes.

Granted we have to work with what's available. In certain areas it's probably best if all the home stations don't default to RELAY due to channel congestion in areas with a "dense population" of APRS stations.

I guess my main point is that many ops are (like I was) probably not aware that WinAPRS isn't defaulting to a MYALIAS of RELAY. Many of these home stations are have both excellent location and coverage to supliment the area's digi's by providing RELAY coverage to mobile/low power stations.

Was this feature turned off for a good reason and the documentation not updated? Is this a bug? Or was I (and a lot of others in my area) not doing something right? Maybe we're all overlooking something here, I don't know, but I'm open to constructive comments on this.

Thanks in advance.

Hi all,

James L. wrote:

>I have run [a '202] on 15 V with no problems. Just more output power.
>I'd be concerned about running a high duty cycle as the radio my not
>have good enough heat sinking.

     FYI, the '202 is designed for 5 watts output. While almost all are capable of at least 7 (I know of at least one that peaked out at almost nine!), neither the heatsink nor the PA finals are designed to handle it for any length of time.

     To see a practical demonstration of this, feed the thing 13.8 V and transmit for a long time while holding the radio in your hand. I've known at least five people whose '202's PA's literally desoldered themselves from the board! This was especially true for earlier "Realistic" branded radios, although the later "Radio Shack" branded versions also suffer from this.

     If you really need more juice, either buy an amplifier or a better antenna. I managed to get the last three RS bricks (5W in-30+W out) in my local RS for $25 apiece. And a better antenna is, in effect, a cheap amplifier with no further power requirements.   73

TAESVR>APRS:NWS-WARN :SVR WITH DAMAGING WINDS 4 MILES NORTH OF MICCOSUKEE
{E85AC

For example
TAETOR>APRS:NWS-WARN :TOR mov NE  @40 03 SW   of CAMILLA {E5fAC
should read on a d7a-

TOR mov NE
@40 03 SW
of CAMILLA {E5fAC  <next screen>

and on a d-700 should read (with WARN in the upper right corner)

TOR mov NE  @40 03 SW
  of CAMILLA {E5fAC

These packets are specifically designed not to wrap on either screen - for
clarity
The d7a has three 12 character lines and a 7 character line
The d-700 has three 22 character lines
This means that there is a dead zone at the 23rd and 24th characters to
avoid wrapping.
The lines that were not able to be parsed to vector / speed / relative
position / reference location
such as

TAESVR>APRS:NWS-WARN :SVR WITH DAMAGING WINDS 5 MILES SOUTH OF ENIGMA {E7HAC

are sent as is- they  still contain useful information.

177. [htaprs] Palm Vx Interface to TNC?

From: "Julian M. Frost" <jfrost@odaiko.ss.uci.edu>
Date: Tue, 15 Feb 2000 12:53:36 -0800 (PST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-66163-2000.02.15-14.51.32--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Today's phonecall to Palm Computing's "Technical Support" has to have been
one of the most frustrating wastes of time in my whole life!

<VENT MODE ON>

Firstly, I talked to the Sales department. My request was simple: Do you
have a serial cable that goes from the Palm Vx to DB-25 or DB-9 connector.
Their answer was "I don't know, here's technical support's phone number".

Rather than dial long distance, I emailed technical support asking for a
source for the connectors that go on the Palm Vx. After three go-arounds,
they said "this is not a technical question" and that they were hoping to
be able to answer "non technical" questions via email in the future. They
suggested I call the Sales department!

So I gave in and called the long distance Technical Support number. I
spoke to a lady who was having a real hard time understanding the words
"serial cable" and "connector". She couldn't understand what I was trying
to do, "interface the Palm Vx to a piece of external equipment?"

She put me through to a supervisor, who had probably even less of a clue
than the previous "Technical Support" person. "What kind of connector" did
I need, he asked? The one that fits the Palm Vx!!". He said they made the

Travel Kit, which looks like it might do the job -- it's a connector for
the Palm Vx (Yippee!) and a DB-9 -- and that I should talk to Sales about
it. I said that was great, but I needed technical information about that
accessory. I needed to know how it was wired up. "Wired up? What do you
mean?" Well, for a start, how many wires are soldered onto the connector?
"Soldered? What connector?". See how this rapidly became frustrating? :-)

Things got steadily worse, and worse, and worse. It took 10 minutes,
literally, to get him to correctly type in a simple web page address ("No,
it's not 'www.palmorder.modusmedia.com', just 'palmorder.modusmedia.com'",
"no, that's capitol 'P'", "no, just the letter 'P' is capitalized because
you can't capitalize the *number* '5'" and so on).

The "Technical" people just don't seem to understand that they supply the
Palm Pilot series of PDAs with a connector that allows them to communicate
with external devices, such as modems and computers, but they have no idea
that given this ability, people will want to take advantage of it.

After 45 minutes fo this incompetance, I hung up.

</VENT MODE OFF>

So, my question to the group, finally, is:

Does anyone know a source for the connector that goes on the bottom of a
Palm Vx (which is different from the other, earlier Palm units) so that I
can create my own serial cable?

Alternatively, does anyone know if the cable that comes with the $50
travel kit, that also contains a whole bunch of stuff that I don't need,
will work with a TNC?

If you know the answers to these questions I'd love to hear from you.
Maybe I could also arrange employment for you with Palm Computing's
Technical Support department!

Thanks in advance,

Julian

Along the same lines, wouldn't it make since for a station that is WIDE-N
capable to put the alias in the UIDIGI instead of MYALIAS?

Example : Set Myalias to NONE, Set UIDIGI to RELAY..

While this may not decrease the number of packets in the network, this would
allow easier "reverse tracing" of packets to see exactly how they got to
you...

Subject: [htaprs] Home stations not running "RELAY" alias????

Howdy all,

I've been noticing that the bulk of the home stations (at least in the Cincinnati area) are not setup for a MYALAIS of RELAY. Maybe it's just me or something I'm doing, but I don't think so.

I got to checking and noticed that my own WinAPRS setup doesn't set the MYALIAS to RELAY unless I explicity tell it to do so. The documentation that I've looked at so far gives the impression that the RELAY alias is always set by default via the software, but it's not.

Digi coverage in my neck of the woods is okay for bases, but really spotty for mobiles and D7 HT's. The situation is getting better, but we still have a lot of coverage holes. Many of the home stations in the area have about (some more, heh heh) the range of a lot of the digi's (most of our digi's are really not that "wide" so to speak) and not having them setup for RELAY duties is a detriment to APRS ops in the area as they could fill in a lot of the coverage holes.

Granted we have to work with what's available. In certain areas it's probably best if all the home stations don't default to RELAY due to channel congestion in areas with a "dense population" of APRS stations.

I guess my main point is that many ops are (like I was) probably not aware that WinAPRS isn't defaulting to a MYALIAS of RELAY. Many of these home stations are have both excellent location and coverage to supliment the area's digi's by providing RELAY coverage to mobile/low power stations.

Was this feature turned off for a good reason and the documentation not updated? Is this a bug? Or was I (and a lot of others in my area) not doing something right? Maybe we're all overlooking something here, I don't know, but I'm open to constructive comments on this.

Thanks in advance.

73's de Jeff, KD4EVB

179. [htaprs] D700A, GPSIII+, and DGPS Works

From: "Steven J Adams" <adamss@datasys.net>
Date: Tue, 15 Feb 2000 19:50:43
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-66209-2000.02.15-19.48.37--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There were some comments awhile back about whether DGPS works on the D700. I'm happy to announce it works and works with the Garmin GPS 3+ also.

Locally we are using the TAPR DGPSIB to transmit out the DGPS signals on the APRS frequency. The D700 receives the signal and routes only the DGPS data to the GPS unit - with no header.

Good job Kenwood! I'm very impressed with the D700.

This is a common problem with almost ALL the handheld manufacturers (support). It's important to remember
that the target market for these manufacturers is the (with all due respect) suit on the street that's going
to buy one, pop the box, and use it, not attach it to a TNC, radio, or anything else in general (or if they
did, they'd buy a complete solution). There are millions more of them than there are of us.

Any sort of technical question we're likely to ask gets answered (including pinouts) by their "Developer Technical Support", or DTS. They handle not only software SDK questions, but hardware licensing, interfacing, and so on. Their web site has a bunch of info, including a free area to sign up and get NDA-only material at http://www.palm.com/devzone.

Of course, if they'd had any sense, they'd have said, "I dunno. Our DTS doesn't give phone tech support unless you pay us a lot of money. Why not go to our web site?"

They've got a good web site at www.palm.com; follow the link to the developer guide. There, you'll find
pinouts. Specifically for the Vx:
Pin 1: "DO" A Nonstandard data out, consisting of the voltage-doubled data out pin.
Pin 2: V++, used by the HotSync button. DO NOT POWER PERIPHERALS WITH THIS PIN.
Pin 3: RS232 RxD: Data in.
Pin 4: RS232 RTS (Request to Send)
Pin 5: RS232 TxD: Transmit data out.
Pin 6: RS232 CTS: Clear to Send
Pin 7: I1, interrupt to initiate hotsync process. Jumper to V++ across a 150-ohm resistor & 0.01uF divider.
Pin 8: I2, interrupt to indicate peripheral hotsync.
Pin 9: Unused (reserved for expansion)
Pin 10: Signal ground.

Note: PLEASE CHECK THESE WITH THE PALM DEVELOPER WEB SITE BEFORE USING THESE PIN ASSIGNMENTS. I WON'T BE
RESPONSIBLE FOR TYPOS, ERRORS, &c.
(I'm mostly a software guy anyway. :)). You can get that info from
http://www.palm.com/devzone/hw.html.

The connector's the hard part -- it's nonstandard and I don't know of a vendor. I'm intentionally going to
avoid any comments about this.

As an update to my original rant...

Thanks to all those that replied with cable solutions. I have a Swan Modem
cable on its way (back ordered) and a "Bridge" on its way right now.

The pin outs are not he problem... they are available on the web page. The
connector *is* the problem. No one seems to have it, including, it seems,
the manufacturer!

Julian

I used a standard hot synch cable and a radio shack db9 null modem adapter.
I then cut off all pins on the male end of the db9 null modem adapter,
EXCEPT pins 2,3 and 5 which are the tx data, rx data and signal ground. This
seems to accomplish what Mike is recommending, in terms of excessive power
drain with a full handshaking null modem connector.

I've got mine working great with a single port pico and the Palm IIIx,
pocketAPRS 1.03. I just enter my position manually with the "i" command by
tapping on the map.

When I can afford to get a KPC3+, I'll put my Garmin II+ back in the system.
For now, I don't find it any problem at all to tap the map! 73

  Actually, as a person who works in a call center, I think the problem
here is that Julian was probably put in touch with an OUTSOURCER, or more
euphemistically, a "business partner" of the company that really produces
the product.

Bear in mind that the person answering the phone is in general:

A) Someone who makes $7 per hour
B) Functionally illiterate
C) Someone who will not be doing tech support for that product in 3 months
(or any tech support)
D) Someone who's performance review entails his average talk-time and not
customer satisfaction
E) has a computer deciding when his breaks are (never mind what the body says)
F) Doesn't own the product he's supporting
G) Does product support for several products/companies (ie Palm
Pilots/Emerson VCR's/Singer Sewing Machines...
H) trained for about 4 hours on the product (and that was 3 months ago)

Rendered body type: text/plain

This is really basic and I'm embarrassed to ask, but I'm stumped.

I'm trying to get a couple of laptops to detect and use KPC-3 Plus TNCs using
Hyperterminal. I've also had no success getting them to detect my TH-D7A. The
oldest laptop, running Windows 3.1 Terminal is fine. Two others, running
Windows 95 and 98 can't find the TNC. I've even tried connecting a USRobotics
modem to the COM port - can't find that either.

I know to have everything connected before I boot up. I've toggled the TNC off
and on to see if it will send its little setup, prompting for baud rate and
callsign and go to cmd:. Nothing.

I have successfully used the same TNCs on two desktop PCs running Hyperterminal.

Thanks in advance.

> Windows 95 and 98 can't find the TNC. I've even tried connecting a USRobotics
> modem to the COM port - can't find that either.

Perhaps it's the serial ports of the laptops themselves. RS-232 signal lines are supposed to be bipolar -- negative for a Mark (logic 1) and Positive for a Space (logic 0). Since laptops are battery powered, a negative voltage source must be "derived" using a DC-DC converter or charge-pump circuit. I have heard rumors that some laptops don't even bother, they swing the signal lines from positive to 0 (zero).

The TNC's are faced with the same problem. -- They're powered from a positive DC source, so where are they going to come up with a negative voltage?

One clever way is to steal power from the Tx data line through a blocking diode to charge a small electrolytic capacitor, since the Tx data line is at a Mark when idle. Of course, this won't work if you don't get a negative voltage from the equipment you're connected to.

Try measuring the Tx data signal lines on both the TNC's and the PC's when the ports are enabled (HyperTerminal is loaded and assigned to the serial port) but idle. If there are no negative voltages preset, you may have to switch to a different brand TNC or laptop.

Good luck & 73!

Rendered body type: text/plain

Hello,
This is probably SOP for many of you, but it's not sinking in for me yet. Would someone be able to explain what the best root directory and sub directory order would be to set up and keep Win APRS running correctly and smoothly? I would appreciate it. I am having much trouble with having the all my map files open properly without manually opening them from the "Files" menu prompt. I want them to open from the "Maps" or the "Lists" menu prompts the way they are supposed to. The "counties maps files" aren't working to issue watch/warnings for weather mode also.
Thanks alot in advance.

188. [htaprs] MCP Software - Data File Format

From: "Edward A. Behl" <ed@eabehl.com>
Date: Fri, 18 Feb 2000 16:47:02 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-66567-2000.02.18-15.44.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi, All -

I wanted to share some information that was kind of an exciting
discovery for me.

The ARES Emergency Coordinators of the new West Central Florida Section
have been knocking around the idea of providing programming information
for various PC-programmable radios that would have the various emergency
service repeaters and simplex frequencies for all of the nine counties
in the section. This data would allow visiting hams providing mautual
aid during disasters to preprogram their radio before they leave for
radio facilities in the area they are going to help in.

I started investigating the software available for programming
PC-programmable rigs, much of it supplied by R-T Systems in Huntsville.
Many of you know that Kenwood also has developed such software for the
TH-G71, TM-G707, TM-V7, and TH-D7, and TM-V700, and posted it on the FTP
for free downloading.

My concern was how to make data available in a format that could be
easily used for loading into radios of all makes. The R-T Systems
software has the ability to import and export ASCII files, but the
Kenwood MCP software does not. This morning I decided to open up the MCP
data files to see if I could decipher the way data was stored in the
file.

To my total astonishment and great glee, I found out the files contain
simple ASCII text! As a result, you don't *need* an import or export
feature in the MCP software -- it's pretty-much built in. In addition,
the format of files appears to be consistent from one model to another,
so that data from a TH-D7 can be imported right into a TM-D700, and you
can cut and paste with your favorite text editor from one radio to the
other.

Of course, you still need the software for each specific radio model,
but Kenwood gives that away for free! And with the help of information
supplied by Jim Gill, N0RMO and Darryl Smith, VK2TDS, someone could
easily develop a VB application to load and dump the memory files.

For a detailed description of the MCP data file contents, you can go to
my website, at http://www.eabehl.com/hamradio/ken-mcp.txt

APRStk combines APRS monitoring, Satellite Tracking, and Automatic radio
tuning for the Kenwood data radios so your old DOS PC in the corner can
keep you informed of everything that is going on on your local APRS
frequency and any of the digital or FM satellites.

This latest version K04 fixes the bug that limited automatic tuning to
only the HT. Now either the handheld THD7 or the TM-D700 can be used.

Your link appears to be broken. I would really love the check out your
site, Ed.

I have listings of the programming data structure since the TH-78. It was
harder to get that one because there is no programming software, they
refused to publish or share the spec, and I had to tape record a "cloning"
session and use audio editing and dtmf decoding software to figure it out
character by character. I use a tone generating software program that
works with any sound equipped pc to store files of the different programs
and program any radio I have that allows programming. I got tired of
having to use so many different cables, software and radios. I like the
Kenwood radios and their data structure has changed very little with each
radio.

Sorry I know this is a bit of the subject but could some one tell me where I
could find a program called HAM WEB on the tapr ftp site.

Many thanks

Rendered body type: text/plain

Hello ,

today i tried to send a message from DD1AAA via RELAY to DG4KLK-5.
But DG4KLK receives only mR DD1AAA on his TM-D700e.

I know the indicators like dP, dS, >P. but mR I don´t find in
the manual. (Maybe it was rM instead of mR).

Anybody who can help ?

Bye
   Andreas Puschendorf
   DD1AAA, Germany

Rendered body type: text/plain

I've been runnig a D700 for several weeks now and having a great
time. Recently I noticed that the Position page assigns "Time Set" to
one of the soft keys. Has anyone been able to figure out what this does?
Even when hooked to my Street Pilot it does not appear to set the time
on the D700.

I do apologize for my absense from the list as of late. My mother who
has MS fell recently and suffered a depressed skull fracture. She has been
released from the hospital today and will return home with me to recover.
We were worried about the swelling in her head as the CT scan showed no
space between her skull and the brain.
    As a result I have not devoted my time to the APRS list as much as I
should have. I am starting to work on the maps problem this week. Will let
you know how things go in the next week or so on the map problem.

Anyone played with this.

I live at 34 05.12 and 83 56.80

I was playing with the position abiguity and set it for 1. suppose to do
34 05.1 and 83 56.8 - It didn't.

So I set it to 2 and was expecting it to do 34 05 and 83 56 - straight from
the documentation - It doesn't.

In fact I got 35 05.12 and 103 56.80

So, don't use that features it's completely broken!

Here are my posits from a digi. Could it be the digi missed the
translation???

No, it works. What you are seeing is your Mic-E posit from the radio
being converted by a digi, APRServe, or someone elses software to a
different APRS format. Since some of the authors refused to agree to a
standard for this conversion, what you see is what you get.... Good luck.

I thought it set the TNC time to the GPS's time.

Sorry, this is because the TNC that Kenwood used was designed only for
single packet mobile data. The TNC has MAXFRAME of 1. This was in all
the advertisements at least here in the USA, but it slows down the bulk
transfer of data when more than one frame is included in each packet.
de WB4APR, Bob

P.S> I wonder if this is also true of the D700? That would explain the
poor performance in CONNECTED uplink transfers with the PACSATS!

No it isn't Bob.. As I read the D700's Tnc Command List,
Maxframe is default
to 4 with a parameter of 1-7.. Also, I read it as "Maximum

number of
packets to be transmitted at one time."

Unless I am missing the point, we are talking about two
different things.
Jari Sivula sez, > > that TH-D7 sends ack every second
packet it receives.

Whereas you are talking about Maxframe...

I may learn something here too I hope, :-)

Thanks for looking up the MAXFRAME in the D700. That is good news.

But back to the THD7, although it is in general a TRANSMIT commmand, it
could have something to do with internal BUFFER size, and so it might
only ACK one packet at a time and not wait for as many as 7 before sending
a combined ack. But you may be correct. It may only affect transmit, but
it was the only thing I could think or that 1) is different about the THD7
than conventional TNC's and 2) that may cause the effect he was seeing..?

I would love to learn more about it too.. anyone?

206. [htaprs] D-700 software problems

From: Richard Carter <rich.carter@windriver.com>
Date: Tue, 22 Feb 2000 15:24:57 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-67300-2000.02.22-14.22.56--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I found what I believe are two problems with the D-700 software provided by Kenwood.

The 70cm default repeater offset is 600khz instead of 500khz. When you enter a 70cm repeater frequency, it defaults to the wrong offset. This means that you must hand enter the correct offset.

There is no way to enter a special character (e.g. ampersand) in the auto-reply message. This means that you can't enter your email address in the auto-reply field.

Kenwood has not been receptive to my complaints in the past. I'd like to be sure that my observations are correct before I contact them. Any comments on the above two bugs? If anyone else has found bugs, please let me know so that I can include them.

208. [htaprs] VISORs, TH-D7A, PocketAPRS and "Pin 2"

From: "Mark Keiser" <mkeiser@chi.navtech.com>
Date: Tue, 22 Feb 2000 16:05:00 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-67364-2000.02.22-16.03.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi HT-APRS community,

I'm ready to play with my VISOR and pocketAPRS. I saw the interfacing comments for the Visor on the web page, and I
wanted to send you this excerpt from the Developers manual, because (frankly) I may be over my head here.

On your Visor page (http://www.pocketaprs.com/visor.html), it said to insulate Pin 2 from the stand ("...there is a way
to "fool" the Visor serial stand into talking to RS-232 devices without finding a way to separately power the stand. To
do this simply involves insulating Pin 2 ("KBD") from the stand..."). I have a Visor-connector-to-bare-wire cable
(after cutting off the USB connector), and I wonder whether you could interpret the following excerpt as grounding Pin 2
to the ground in the connector as fooling the Visor, and getting it to accept from and provide commands to the TH-D7A.

If anyone could help me understand this, and whether this will work to drive a TH-D7A, I would be grateful. My goal is
to get the GPS Springboard module for my Visor, and then just have a Kenwood TH-D7A and the Visor with an internal
module for GPS as my portable APRS station.

73s de N4OGL
====
Excerpt from the Visor Developer's Kit, page 72 (you can get the whole development kit in .pdf format at http://www.handspring.com/developers/developers_kit.asp):

The handheld platform supports character input from an external keyboard or pen-based device through the Cradle
Connector located at the bottom of the handheld device. Pin 2 of the eight-pin Cradle Connector is the □keyboard detect□
pin (KBD*). Grounding this pin indicates to the handheld processor that:
1. A keyboard or other remote UI device is present on the Cradle Connector, and
2. Incoming serial data packets on RXD (pin 1 on the Cradle Connector) should be interpreted as described by this
document.

Note that the Cradle Connector does not include hardware signaling for buffer overflow conditions within the handheld
device. Therefore the maximum recommended serial transfer speed to the handheld device is limited to 9600 kbps.

Remote UI is supported in all existing versions of PalmOS; for more information please see the PalmOS Programmer□s
Companion at http://www.palm.com/devzone/docs.html.

3.1 Remote UI Packet Description

As long as pin 2, KBD*, on the Cradle Connector is held low, the handheld will receive incoming data packets on RXD and
interpret them as Remote UI Packets. Remote UI Packets have three sections: a header, a body, and a CRC as shown in
Figure III.1.

Rendered body type: text/plain

Hello to group. I am a newbie to APRS/packet, having just purchased a
PicoPacket to fit between my Palm 3X and Yaesu VX5. Testing the connections
with "simpleterm" shows that I can send commands to the TNC, and can get
the TNC to key up the xmit with beacon text of "W4MCH Testing". When I try
to run Pocket APRS I receive tons of stations, but when I try to "transmit
position" no key up from tnc to radio, and the data stream shows "?unknown
command". Yes, I configured to pico in the setup screens, entered my
lat/long correctly, set the xmit control on and even removed the event stn
filters. As a last resort I even read the doc file!
Any ideas? I am sure that I am overlooking something right in front of me!
Thanks to any & all for help.

Rendered body type: text/plain

I'm using a single port Pico with my Palm IIIx OS 3.3, pocketAPRS 1.03. It
works just fine, so ....

I have gotten that message before.

I reset the tnc (soft reset...really a "restart"). I cycled the power to the
tnc off/on. When I did this, my pico lost its brains and reverted to 9600
baud. I brought up my terminal program for the palm, SimpleTerm 5.1. I
reprogrammed it for 4800 baud, did a "restart", so all the parms would
"take". (I made sure no hardware handshaking was on when I restarted).

I then reconnected the palm, after having turned it off and on, restarting
pocketAPRS from scratch, and the tnc initialized just fine.

Since that time, I have had no more "unknown command" messages, nor any
further "tnc not responding" messages from pocketAPRS.

So, I would start from scratch with the tnc, do a full reset, so you are
working from defaults, program in the appropriate terminal speed...I would
recommend 4800 baud...I did not get good results at 9600. Then, once you
have made sure you have really "quit" pocketAPRS, turn the palm off and then
on, restart pocketAPRS and see if it will then talk to your tnc. I would
also suggest, that during the time pocketAPRS is initializing the tnc, have
your radio turned off, so the tnc is not trying to process incoming packets
while it is being reprogrammed. I have learned not to turn my radio on,
until AFTER pocketAPRS comes up with its default screen. Then I immediately,
manually, send a position report.

Hope this helps ya. 73

Rendered body type: text/plain

Some people report that APRStk does not tune their radio. I just figured
out why this happens to some and not to others.

IF you dont have your FUNCTION-STEPSIZE set to 5 KHz, then the radio will
not tune to the commmanded FREQ unless it is a multiple of what you
have set in your radio (Default is 25 KHz).. So this might be it...

For those of you that said it wont tune, would you confirm if this fixes
it for you?

ALso, APRStk is computing instantaneous doppler. but round-off errors
cause it to jump around a bit. I need to add a weighted filter to this
routine so it doenst jump around so much... Ill let you know when I
finish this..

Bob, WB4APR

When connected to a GPOS receiver, pressing the "time set" button sets the
D700's internal clock (yes, the D700 has one!) to the GPS time (from the
NMEA string received from the satellite).

Mark,
I once spoke to HandSpring regarding the Visor's serial port and basically
the Visor is not a true RS-232 device because the port signals are 0-5V and
not +12v to -12v required by the TH-D7. The only way to get a true RS-232
signal is to add a level converter or buy the Visor's modem cable (if you
can find one) which has a built in converter.

Hi Gang,

Just got my tmd700 in hb9.. probably the first one...

As this is an E-Type (not a Jaguar) would like to know the
modification to use it in USA.

Probably changing a diode or 2 so I can use the set on 144-148

Tnx in advance

Hi Daniel,

I have the Visor USB Cable (found at http://www.handspring.com/products/cradlescables.asp). Is that
what you mean by
"modem cable"? Or is there an alternative source? I have the USB cable, and just wondered if I can
modify it by
cutting the end off and putting on the right plugs and a power source.

Mark,

I have a Palm Pilot Pro and I can connect my cradle to the TH-D7 via a null
modem connector. The Palm Pilots have a true serial port (RS-232 compatible
voltages) but in order to make the Visor cheaper and more energy efficient
HandSpring didn't put any level converter in the Visor. Basically you could
cut the connector off your cradle and put a DB9 or DB25 but the signal
voltages are not compatible with RS-232 devices. The bottom line is you
either need to connect your cradle to some kind of a level converter or buy
the proper Visor modem cable which should have a built-in level converter.

222. [htaprs] Sending email from a D7

From: "Ronald Ross" <rossr@adicomw.com>
Date: Wed, 23 Feb 2000 17:22:36
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-67604-2000.02.23-17.20.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi

Can anyone tell me how to send email messages from the D7.

I have figured out the "To:EMAIL" and the address and have had
messages delivered but the content of the email is empty when
I receive it.

I am leaving a space after the email address then a short message.

Does the text of the message need to be preceded by anything or
terminated by anything?

regards
Ronald , KE6JAB

Rendered body type: text/plain

Ronald KE6JAB wrote:

> ...Can anyone tell me how to send email messages from the D7.

There are two ways to do it from any aprs station (D7A,
WinAPRS, DOS, MAC whatever).

First you have to be within range of an IGATE.
The two methods are -

Destination:EMAIL
Message:address@something.com <space> enter your txt message here
        (obviously fill in a valid email address)

-OR-

Destination:ab0gd-IM (Substitute the callsign you're sending to.
                      The 'IM' stands for internet mail)
Message:enter your txt message here

In the second example, the system mines callservers for the
callsign you enter for the destination. If it doesn't find
a valid email address on the callserver, the message gets
sent to ab0gd@arrl.net (again substitute the call you enter).

So if the ham you are sending to has his/her email address
listed on callservers or has the arrl.net address thing,
the email will be routed to him/her.

Hope that 'splains it.

Another question on the D7A. How do you clear the msg list? Say if you by
mistake send a message before you finish typing it all in. Then how do you
kill that message so you can resend it in it's entirety.

You don't.

There is no way to kill sent messages.

> There is no way to kill sent messages.

However, you can cancel a current unacked message from finishing its
remaining number of transmissions. Go into the message list, and press the
A/B band switch (which is also the delete key). This changes the status of
the message from " + " (unacked and sends remaining in the queue) to " . " -
which means essentially unacked and timed-out. " * " means the message was
acked (before the expiration of the 5-send limit).

You could cancel the incorrect message, then while in the message list,
displaying that current message, press the MSG button again. That brings up
that callsign and message in the "compose" mode, allowing you to make the
changes you want in order to send it again.

But Dave is correct, once a message is in the message list, it cannot be
manually *removed* from the list... you must wait for it to "scroll" out as
newer messages replace older ones. The list holds the 16 most recent
messages sent/received.

I understand that this list has blossomed into a discussion list for the D7
and the 700. Please understand I don't want to offend anybody and I know I
leave the list if I desire and all of that. But, I am sure there are many
of us who don't own one of the new Kenwood D700 radios and have no
intention of buying one any time soon.
So here is my question, would it be possible to move the discussion of the
D700 top another list on TAPR? Probably 85-95% of the discussion is on the
D700 now and I delete it all.
Please consider starting another list for the D700 and let us have our D7
list back!

Thanks
73

Gary,

I may be way off base here, and I apologize if I am. But this question was
raised beofre, and the answer was that this forum was geared more towards
the HiTech aprs, ie radios with TNCs. So it seems that HT amy have migrated
to Hi-Tech now. Also if I remember correctly, the email said that this
forum would was any/all new technology for APRS as it came out.

Hope this helps.

Scott

Gary, that's extremely short sighted... the two radios are so similar, that any information about one or the other is bound to benefit all Kenwood APRS radio owners. For example, the information on my D700 page that I spent many hours creating is applicable to the D7 in many areas... so D7 only owners benefit too. The traffic is low enough on this sig, that to require a separate list for each particular radio would be unnecessary and inconvenient. You'd likely still end up seeing the messages anyway by way of the crossposting that would ensue.

And now a gentle suggestion of my own: if all this is still a problem for you, use a mailer that offers filtering or message rules... and learn how to use them. Or the other alternative would be: find an area or feature of the D7 that interests you, research it deeply, and post related messages to balance out the sig traffic.

231. [htaprs] D700 Crossband

From: "Mike Cox" <ki5df@home.com>
Date: Fri, 25 Feb 2000 04:29:52 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-67929-2000.02.25-04.30.38--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone got the D700 to function as a crossband repeater, while "A" band is running aprs, and "B" band is on 70cm? I tried last evening and went through the steps listed in the manual. Each time I got to the point of turning on the "crossband repeater" function, I could toggle it on but it wouldn't take. Wondering if maybe it won't do crossband while in aprs mode?

I'm helping in a demo at the National Wx service on saturday and was thinking of using the crossband feature to help get the handheld signal get out of the building better.

Thanks,

A couple of questions: were you trying to use the handheld as a voice radio, or were you using a D7 or HT/TNC with APRS? I don't actually know if APRS mode and Crossband Repeat can be on at the same time... but they're just functionally mutually-exclusive anyway.

If using an HT on voice through the D700 while in APRS mode and crossband repeater mode, it wouldn't be good practice to use the APRS frequency for voice use. In that case, you might choose a separate VHF freq for your voice work through the mobile... but then you wouldn't (likely) have any digis available on that frequency to make use of the APRS feature, so it might as well be off anyway.

If you're trying to get an APRS signal from the HT through the mobile and out of the building, just leave them both on 144.39, and use the digipeater that is built in to the D700's TNC. In the APRS menu, there is a setting for Digipeater ON or OFF. You then set UIDIGI to the generic aliases that you want to digipeat on. There's no need for crossbanding in that case.

Unless I missed what you were trying to do, those two possibilities should just about cover it.

Rendered body type: text/plain

As I've not yet had a chance the luxury of playing with a D700 I can't tell
you one way or the other... But on a few occasions I've used an Alinco
DR-610 to crossband APRS traffic from 144.39 over to a UHF simplex frequency
and vice versa, so my D7A could hear/talk APRS while in a bad location,
worked wonderful...   Of course the DR-610 is not an APRS radio, so you
could try turning the APRS mode in the D700 off and just use the radio to
crossband the "aprs packet auido" as it hears it...

Don, the TMD700A has Digipeat capability built in to the TNC, even when in
APRS mode. No need to crossband... just put all radios on 144.39, set
DIGIPEAT ON and UIDIGI RELAY (or whatever appropriate alias as needed) in
the D700, and let your HT or other APRS rig digi right through the D700.
Let the radio work as it was designed, plus you'll free up the second band
of the mobile for voice work on other frequencies instead of tying it up for
crossbanding.

The only thing to look out for using the UIDIGI method (compared to your
crossband setup) is that if the HT inside the building is having a hard time
hearing APRS traffic from outside, then it may not receive all traffic from
other stations on the local net. You might have to add WIDE to UIDIGI to
make sure packets make it in the building from the mobile to the HT

(assuming that the mobile didn't hear a packet at its last hop with no more left to get inside). Using the crossband audio method assures that whatever the mobile heard outside, the HT will always hear inside, regardless if there was another hop left or not.

You just have to consider the tradeoffs in whatever method you choose.

Hi, Pete here, KD4SPW, in Ft. Pierce, FL.

I have never tried crossband repeat, neither voice nor packet. I have wanted a way to send all APRS packets heard on local RF to my TH-D7A HT. I thought there would be a problem with the time it may take the crossbander to recognize an incoming signal. I expected this to possibly cause loss of the beginning of the packet from being crossed to the other frequency.

It is good to here that the Alinco will work. I guess I'll have to try that new Kenwood TM-V7A I have as an APRS crossbander.

Bye de Pete, KD4SPW.

I once tried crossbanding APRS packets through a Yaesu FT51R to 144.390
with a TNC attached to an Alinco DJ-S41 on UHF.
It worked X-banding UHF APRS packets to VHF and VHF APRS packets to UHF
but I needed to use TXD >500 msec on the TNCs(I used KPC-3
and KPC3+ TNCs).

Check the transmitter rise time on the radio you use as an APRS
crossbander. The slower the rise time spec, the more TXD you'll need.

Also check for over-deviation (adjust tnc-to-radio audio drive levels)
for best results.

The E-Map uses a "special" cable. It is not compatible with the Garmin III+
etc units (which have aftermarket parts available). Since the E-Map is
relatively new, I suspect your only option is to buy a Garmin Emap cable.
They are advertised at the GPS Store for $35. You can get there by following
this link to the handheld accessories page.

I have done this several times for demonstrations and
such, but I don't have a D700. I have my KPC-3
connected to my V7A, and set the aliases to RELAY and
WIDE. It worked quite nicely digipeating right into the
college. Incidentally, I have left the Aliases set up,
and when I want the KPC to digi, I just log in remotely
from my location inside the college, and turn the UIDIGI
ON or OFF. Kinda slick!

Rendered body type: text/plain

Hi all (I suppose more to Mike than others, but figured others may like to know the answer to this too),

Based on Mike's post the other day, I presume the biggest change in the OS is color support. He also intimated that by doing so, the "unofficial" gray scale Mike's been using in 1.03 and earlier is no longer a part of the OS.

Methinks Mike is either going to have to re-do the maps and program in order to support the new OS or will need a work-around to make existing maps work with a new pocketAPRS and the new OS.

The other side of the coin is those of us using pre-OS 3.5 devices (III, IIIx, IIIe, V series, etc.). Is it worth it for us to upgrade our current devices in order to utilize current releases of our favorire applications, utilities and hacks or do we need to bite the bullet and upgrade our devices to something like the new IIIc (and presumably, new Vc and VIIc devices to follow)? Maybe 3com could offer their loyal users a deal in which we could trade in our recent, still-in-production models for a pro-rata discount on one of the new units? Okay, maybe not. But one can wish, can't one?! 73

I used to work for 3Com, I don't think you'll be able to negotiate that type
of deal. With the number of PalmPilot's out there this would cost too much
for 3Com.

Scott

Rendered body type: text/plain

Hi All from Downunder,

Can some kind person tell where to get hold of the female plug that is on
the end of the battery charger that charges the THD7A. A US contact would be
fine, or if someone is willing to purchase 4 of them for me I will send $US
across for the postage and purchase price and when the money is received
they can be posted out to me.

I have purchased some cables that were offered through the honour system,
these cables were the same that come with the handheld, but of better
quality.
The address was to toast@ cant remeber the rest and his name was Jim
Kalkowski in North Haven CT, if you
are after a reference.

Cheers all Ben VK5JFK in Mt.Gambier, South Australia, Australia

247. [htaprs] Earthquakes - quakeAPRS operational

From: Richard Parry <rparry@qualcomm.com>
Date: Sun, 27 Feb 2000 17:15:16 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-68314-2000.02.27-19.13.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last month I released a version of quakeAPRS that supplied APRServe with
earthquake data. That version made some incorrect assumptions about how
APRServe worked which resulted in an unnecessary large number of quake objects.

A new version is now operational. Every 30 minutes it sends to APRServe all
quakes with Richter magnitude greater than 5 for the past 2-3 days. This
results in about 10 objects. Send comments and suggestions directly to me.
I developed this in the hopes it would be interesting, useful, and educational.

thanks,
Rich Parry, W9IF

Ben -

This is the closest I can come up with on the power plug. Radio Shack
makes a replacement DC power cord for radar detectors with a cigarette
lighter plug on one end, and 13mm coaxial right-angle plug on the other.
It's a straight-through job with no electronics except a fuse. The
details are on my website. Look for the link at
http://www.eabehl.com/hamradio/
It's either under files and info, or transceiver programming cables.
Look for info on the D7.

I hope that helps.

251. [htaprs] Wx Data/GPS to single TNC

From: George Carr <amsecllc@telebyte.com>
Date: Mon, 28 Feb 2000 06:31:40 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-68400-2000.02.28-09.19.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Request information on the cabling configuration that allows weather
data, currently using the Peet Bros.Ultimeter 2000, and GPS data strings
to be sent simultaneously from both of these units to a single TNC.

An amateur operator told me that he had this information but has
misfiled it so apparently this capability does exist.

In case you were wondering, a weather station with live GPS would be
used on a boat.

Thanks for your help.

George, N7GME

Message-ID: <LYR845-68614-2000.02.29-15.57.53--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Is anyone out there running pocketAPRS with the D700 Kenwood? I'm thinking
about getting the D700, but want to be sure I can use the db9 on the D700
for the "palm" and still be able to plug my gps II+ into the D700 and have
the tnc read the data into GPStext for pocketAPRs to use. The pocket web
site says it is compatible with the handi d7, but nothing about the d700.

Thanks...

2. [htaprs] quakeAPRS operational, slight changes made

From: Richard Parry <rparry@qualcomm.com>
Date: Wed, 01 Mar 2000 19:09:23 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-68782-2000.03.01-21.07.59--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The new version of quakeAPRS has running a few days now. At 30 minute
intervals it supplies to APRServe all earthquakes greater than magnitude 3
on the Richter scale that have occurred within the past 24 hours. This
results in about 10 objects each day. To see the earthquakes, you need to
look at a WORLD map on WinAPRS, MacAPRS, APRS+SA, etc. since most of the
earthquake activity is outside the US, although California is the exception.

The label has been changed slightly from the original version as indicated
below. Brent Hildebrand and myself felt this would be an informative format
that would meet the 9 character limitation.
ddhhmmqMM format where:
dd = day of quake
hh = hour of quake
mm = minute of quake
q = delimiter
MM = quake magnitude without the decimal point

Here is an example APRS quake packet:
W9IF>APRS:;291855q35*291855z3604.80N\11736.00WQMag 3.5 Depth 0.6 km CALIF

If there are questions, comments, or suggestions please email me directly.

thanks,
Rich Parry, W9IF

Not too early to think about APRS at the Jamboree this summer. A few
years ago I made detail trail maps of the entire Fort A.P.Hill area for
the Jamboree (they are included in the APRSdos Emapsxx.zip distribution).

If any APRS users here on the SIG are into scouting and will be
participating in the Jamboree, plese consider joining the scout-radio SIG
at   scoutradio@onelist.com

Other topics are JOTA and FRS radios in support of scouting.

Hi Bob,
        FYI, the National Jamboree takes place not this summer, but in
2001. For all the Scouters out there, the big event for this summer is
the National Order of the Arrow Conference in Knoxville, Tennessee.
        But as you said, it isn't too early to plan for the Jambo! I'll be
staffing K2BSA most likely (awaiting word from National), so it'll be a
great chance to promote Amateur Radio to the Scouting community and meet
lots of people interested in our hobby.
        If you haven't made plans for the Jamboree yet, better hurry! It
is an excellent experience you'll remember for a lifetime. And Amateur
Radio will most certainly be a part of that experience.

In Scouting,
Brian, N5ZGT

Rendered body type: text/plain

Pardon the posts to the two mailing lists...there has been a 2 meter
repeater there at the Jamboree, but it has been only voice. In 1997 there
was a voice net every evening. As for ATV, I can't answer that because
the repeater set up at Fort AP Hill, Virginia is temporary. So I don't
know what kind of capabilities it will have this year as of yet.

Since the Jambo is so huge (30,000-40,000 Scouts and Scouters from all
over the US and the world), I'm sure K2BSA will have many demonstrations
of the different Amateur modes available. So ATV will most likely be
there one way or another.

And let me mention that the National Jamboree takes place every 4
years...a couple people were wondering about that. :-)

Looking forward to a great time with Amateur Radio and Scouting!

73,
Brian, N5ZGT

I took delivery of a TM-D700E last weekend, but the VS-3 voice synth arrived
a week later.

I've spent a lot of time programming the radio. Does installing the VS-3
cause a reset to happen?

Thanks.

Keith, I'm not sure if it will reset the radio or not. Kenwood does have the
programing software on their web site. You could set it up and "read" the
radio to save your settings then install the VS-3. Then you could reprogram
the radio easily if needed.

Just a thought. Good luck,

73 Mike KI5DF

Mike,

 I installed the VS-3 last week also. The radio did not require a reset but
I have it backed up by the Kenwood software just in case!

  Dwight

16. [htaprs] D-700 mini DIN pin out?????

From: David Vrona <n9qnz@arrl.net>
Date: Sat, 04 Mar 2000 13:43:30 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69182-2000.03.04-13.42.30--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

Does anybody know the pin out for ALL 6 pins on the D-700 mini DIN connector.

The diagram on page 35 of the manual doesn't help enough.

Shouldn't one of those pins provide power?

I'm trying to pull off 5 volts to supply that small Pharos GPS
(www.pharosgps.com) that I posted about a few days ago.

thanks,
dave

Rendered body type: text/plain

David -

The pin-out of the 6-pin mini DIN connector used for the TNC interface
on Kenwood and other "packet ready" FM rigs is based on an ISO standard.
Pin 1 - Tx Audio
Pin 2 - Signal Ground
Pin 3 - PTT
Pin 4 - 9600 baud Rx Audio
Pin 5 - 1200 baud Rx Audio
Pin 6 - Squelch Control Out

Power is not available from any pin per se; however, you may be able to
"steal" a small amount of power from the Squelch line, which is a TTL
level output which indicates when the squelch has been opened by a
detected RF signal.

Check the links below for details:
  http://freeweb.pdq.net/medcalf/ztx/wire/6minidin.html
  http://www.packetradio.org/trad/yft8000r.gif
  http://www.sedan.org/0imgs/5060.jpg

Good luck & 73!

Rendered body type: text/plain

I wonder if anybody has played with sending and retrieving messages
from the TM-D700 ?
I can send messages using the D7 command AMSG but I also need to capture
incomming messages and delete them from the memory.

Also how to youget the radio to report back which band has PTT.
Also how does the command PC work with the 700 ?
With band A on High power if I send PC 0 it reports PC0,1 but with band B
set to Meduim or Low power sending PC 1 reports PC1,1 .
With the D7 the 2nd figure indicates the power setting. (0-High 1-error 2-Low
,3-EL).
I have part of the form in my program that looks like the display so that's why
I'm
trying to find the power and PTT settings so I can get the labels to change on
screen.

Many thanks for your assistance.

No, but it's easy enough to expand the TM-D700E

Take the bottom cover off. Snip the green wire.

Sorted.

And don't forget that this will reset the wireless.

21. [htaprs] Waypoints fm D700 to Garmin II+

From: "hasan schiers" <schiers@netins.net>
Date: Sun, 5 Mar 2000 07:19:10 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69271-2000.03.05-07.19.39--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm a VERY happy new owner of the D700. I'll write up some comments later,
but suffice it to say, "WOW"!

The only feature I cannot seem to get to work the way I expect it to is the
automatic transfer of stations from the D700 to my Garmin II+ as waypoints.

1. I'm running a Palm IIIx.
2. D700 is in TNC Packet mode
3. The waypoint is turned on to NMEA 9 in D700 menu.
4. I have a 3 wire connect using the supplied cable (D700) to my Garmin.

Everything else works perfectly with the Palm IIIx and pocketAPRS. What a
dream mobile station! I get a nice smooth gps track on the maps, I see the
gps data coming in on the monitor screen of the Palm. My position reports go
out just fine....everything is just ducky.

Perhaps in TNC Packet mode the data is not output to the gps? Or have I
missed some parameter? From the way I read the manual, it seems to me that
when I receive a valid position from any station on the d700, that data is
supposed to be translated to the proper nmea format and read by the Garmin
gps II+ (2.07 firmware), and displayed on the map screen with 9 characters
as a waypoint. (I don't really have a "map" on the II+, just a tracking
screen. Maybe that is the problem, it won't even show relative
position...but I did expect it to do so.

This is a "curiousity, not important at all. I would never use the II+ for
any practical map tracking...it's just that the "feature" looks like it's
supposed to be there, and it doesn't seem to work.

Tnx

Rendered body type: text/plain

I have been reading about the TH-D7A factory antenna as being a dog. That
certainly is not the case with mine. I have two of these radios and I am
very pleased with the factory rubber duck antenna. It certainly works a lot
better than my old HT which was an ICOM W21AT. I also like the flexibility
of the antenna.

One comment I can make on this antenna and the SMA connector is that I went

skiing last weekend and had the radio in my jacket inside pocket and the antenna almost fell off. Apparently the constant up and down motion unscrewed the antenna and when I reached into my pocket to pull the radio out, the antenna came off. So, just a word of caution for the active outdoors users of this radio.

I am completely satisfied with this radio and highly recommend it. Am still waiting for an HT like the TH-D7A with a built in GPS like the Garmin III+ with maps. Boy, wouldn't that be neat for a small tracker. It would also be neat if this radio could be used as a portable digi on a mountain top. Just dreaming........

I've got a couple of aftermarket antennas I've been using. I was pretty happy with the stubby Maldol Active Hunters we run on our FT 51Rs, so I have a similar Comet MH-209SMA that's almost identical, but with an SMA connector. It's about the same in performance as the stock stick, at half the length, and more flexible. It works OK for me around town.

I have another one, also. It took me a while to find it the first time, and it took me a while to find it again today. (Manufacturers should really figure out how to label their HT antennas. Maldol did it to the Active Hunter, but Comet didn't label either of these antennas.)

It's a Comet SMA24. It looks similar to a Diamond RH77CA, but 2" longer (17") and about half the diameter, with an SMA connector on it. The whip is the diameter of a pencil lead and pretty flexible (I can coil it into a 2.5" diameter circle to stick in my fanny pack). From the slightly thicker 4" section at the bottom, it might be a collinear design.

Go to the AES site and look for these on the Comet page.
http://www.aesham.com/cmt.shtml and ctrl-F (Find) for SMA.

MAHA makes some rechargeable battery packs for the D7A. They have a 9.6 volt NiMH with the same AH as the stock NiCd pack, so you can get higher Tx power with the same battery life, and it charges OK on the Kenwood chargers. I have the Kenwood AA case, too. It only holds 4 cells and the Tx

output is kinda wimpy.

BTW, the D7A, my GPS III+, cables, spare antennas and batteries, lighter plug etc. fit pretty well in one of those Rat Shack "communications" fanny packs with the radio pocket on the outside.

Hope this helps.

73,

Chris KD6DSI

I'm using the Comet SMA-503. Got it from R&L in Cincinnati, http://www.randl.com/. It performs much better than the factory HT, but it also picks up birdies from my old GPS while it is trying to acquire too. Poo! (the VHF AIP seems to help this.)

The one disconcerting thing about it is that it is much slimmer than the original, and will tend to deform if you put too much of a kink into it. (Like when you put a jacket on over it while wearing the HT.) It can be bent back, and I don't think I've hurt its performance any. I'm just afraid one day it'll come apart.

TomB

Rendered body type: text/plain

I ordered one of their GPS units.
http://www.pharosgps.com/product/igps180.pdf

It comes with the Cable terminated in a DB-9 and a PS-Mouse connector.

The GPS wants +5V on pin 4 and GND on pin 3 of the PS-2 mouse connector.
I went to Radio Shack and purchased their Mouse extension cable.
When I cut the extension cable open it was color coded...

Black= pin 1
Brown = pin 2
Red = pin3
Orange=pin 4
Yellow= pin 5
Green =pin 6

So I put 5V on the Orange lead and grounded the Red lead.
The DB9 seems to have the same pin-out as my Garmin adaptor cable,
so no Null modem was needed.
The GPS came up at 4800 baud 8,n,1

Without changing it's configuration it sends the following messages:
$GPGGA
$GPRMC
$GPGSA
$GPGSV

The manual with the unit is extremely lacking..... not even a pinout,
but the unit is tiny and seems to work well.

Paul (Kl7JG)

28. [htaprs] Complete uncorrelated list of D700 commands

From: "John \"Chris\" Wren" <jcwren@jcwren.com>
Date: Sun, 5 Mar 2000 22:21:09 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69350-2000.03.05-21.20.03--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I got a little bored a few days ago, so I wrote a small Perl script to
probe the radio for all commands that contain alpha-only characters. It
tests all possible command combinations from 1 to 5 letters, containing only
the letters A-Z (no lowercase, seems irrelevant). I know many of these
commands are documented on Jim Gills site
(http://home.netcom.com/~jimgill/tmd700a.htm). I haven't had the time in
the last few days to correlate these to the known commands, but I know
through some experimentation that a number of the commands listed don't
appear in any lists I've found. If you want to figure out what they do, and
let me know, I'll add it to the spreadsheet I'm building. I do know of
several commands that appear in the TH-D7a that don't appear in the D700,
and vice versa. Look at www.kd4dts.com/amateur/radios/tmd700/index.html in
a few days to find this list, and a Excel spreadsheet with what I know so
far.

    I let it run up through 'BGWPMF' before I aborted the test so I could
actually install the radio in a vehicle. I didn't find any 4 letter
commands past VVOL, none in the 5 letter group range, and none in the 6
letter group range that I tested up through. I pretty much trust the
software, since it did find every command that is documented in Jim Gills
list (take that for what you will, it's only software).

    A command was considered as existing if it returned anything except a

'?<CR>', which indicates the radio doesn't know what it means. All commands the radio knows about return 'N<CR>' if improper parameters are supplied. Note that some commands are not valid unless the radio is in a certain mode (I can't remember what they were, but there were two that were ignored if the radio wasn't in VFO mode when the command is issued). Note that the script doesn't test *through* the TNC, so any possible TNC specific commands won't be listed. If a command returns more that one line of data, I edited down to one command per line.

    There are 6 commands that timed out that have something to do with the SSTV. I haven't had time to research those (not much interest, to be honest!).

    If you have any questions, feel free to e-mail me. I'll provide the Perl script to anyone that asks (it'll probably wind up on the afore-mentioned web page if more than two people are interested...) It's written for Linux (serial ports), but *easily* ports to Windoze with the serial port library.

    (161 commands are listed below, if you didn't want to count them yourself...)

What is the price? I don't see it mentioned.

Mark

31. [htaprs] RE: Waypoints fm D700 to Garmin II+

From: "Richard Carter" <rich.carter@windriver.com>
Date: Mon, 6 Mar 2000 09:36:50 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69428-2000.03.06-08.35.21--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Garmin does not adhere to the NMEA standard. In order to transfer
waypoints, you must change the interface protocol in the Garmin GPS unit to
their proprietary protocol. After transferring waypoint info, switch it
back.

I don't know why garmin did this. They screwed-up an otherwise fine product
line.

Good luck
Rich Carter - KE1EV

Subject: [htaprs] Waypoints fm D700 to Garmin II+

I'm a VERY happy new owner of the D700. I'll write up some comments later,
but suffice it to say, "WOW"!

The only feature I cannot seem to get to work the way I expect it to is the
automatic transfer of stations from the D700 to my Garmin II+ as waypoints.

1. I'm running a Palm IIIx.
2. D700 is in TNC Packet mode
3. The waypoint is turned on to NMEA 9 in D700 menu.
4. I have a 3 wire connect using the supplied cable (D700) to my Garmin.

Everything else works perfectly with the Palm IIIx and pocketAPRS. What a
dream mobile station! I get a nice smooth gps track on the maps, I see the
gps data coming in on the monitor screen of the Palm. My position reports go
out just fine....everything is just ducky.

Perhaps in TNC Packet mode the data is not output to the gps? Or have I
missed some parameter? From the way I read the manual, it seems to me that
when I receive a valid position from any station on the d700, that data is
supposed to be translated to the proper nmea format and read by the Garmin
gps II+ (2.07 firmware), and displayed on the map screen with 9 characters
as a waypoint. (I don't really have a "map" on the II+, just a tracking
screen. Maybe that is the problem, it won't even show relative
position...but I did expect it to do so.

This is a "curiousity, not important at all. I would never use the II+ for
any practical map tracking...it's just that the "feature" looks like it's
supposed to be there, and it doesn't seem to work.

Tnx

73

Hi Richard

Garmin does comply with the NMEA standard. Waypoints are plotted fine on my GPSIII+ using the standard NMEA input/output and my D7A. Haven't got my D700 yet but I'm sure that will work as well (I hope!).

33. [htaprs] Re: htaprs digest: Waypoints fm D700 to Garmin II+

From: "Neil ke6ncx" <ke6ncx@hotmail.com>
Date: Mon, 06 Mar 2000 06:59:02 PST
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69440-2000.03.06-08.58.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I own a D7A, not a D700, but I understand they're the same in this way
(along with many others.) The output to the GPS is a feature of the "APRS"
mode. When the TNC is open in the packet mode, n output t the GPS.

Neil Fullagar, KE6NCX

  The only feature I cannot seem to get to work the way I expect it to is
the
  automatic transfer of stations from the D700 to my Garmin II+ as
waypoints.

  1. I'm running a Palm IIIx.
  2. D700 is in TNC Packet mode
  3. The waypoint is turned on to NMEA 9 in D700 menu.
  4. I have a 3 wire connect using the supplied cable (D700) to my Garmin.

  Everything else works perfectly with the Palm IIIx and pocketAPRS. What a
  dream mobile station! I get a nice smooth gps track on the maps, I see the
  gps data coming in on the monitor screen of the Palm. My position reports
go
  out just fine....everything is just ducky.

  Perhaps in TNC Packet mode the data is not output to the gps? Or have I
  missed some parameter? From the way I read the manual, it seems to me that

when I receive a valid position from any station on the d700, that data is supposed to be translated to the proper nmea format and read by the Garmin gps II+ (2.07 firmware), and displayed on the map screen with 9 characters as a waypoint. (I don't really have a "map" on the II+, just a tracking screen. Maybe that is the problem, it won't even show relative position...but I did expect it to do so.

This is a "curiousity, not important at all. I would never use the II+ for any practical map tracking...it's just that the "feature" looks like it's supposed to be there, and it doesn't seem to work.

Tnx

I can't speak for the latest Garmin units, perhaps they fixed the problem. The NMEA-183 standard defines a protocol for transferring waypoints and routes. Garmin units that I've used do not recognize these sentences, but instead require that the user switch to a proprietary protocol. This must be done by pressing buttons on the Garmin, so it can't even be automated. To my knowledge, Northstar and Magellan are the only popular units that fully comply with NMEA-183.

Hi Richard

Garmin does comply with the NMEA standard. Waypoints are plotted fine on my GPSIII+ using the standard NMEA input/output and my D7A. Haven't got my D700 yet but I'm sure that will work as well (I hope!).

> Just dreaming........

I'm sure there are some SmartGuys at Kenwood and Garmin who have this thought
already. We are still in Gen 1.. just you wait until Gen 2 (oh boy oh boy).

It should also use RTCM dgps corrections received on the APRS frequency. Ooo
Ooo Ooo. And be able to be configured as a dgps base station if you supply
it's exact location, or allow it to figure out it's exact location by averaging
out selective availability.

And it should run Linux, with all of the software open-source.

The D7 is a great radio for what it is... so it's easy to imagine it having
every dream feature imaginable. Still, I don't know how comfortable I'd feel
with an $800 HT on my belt. The D7 is expensive enough as it is that I'm
anxious about dropping it -- an unfortunate event that an HT owner must accept
will happen.

No I have not yet cut their cable.
My color are the colors in the RadioShack mouse extension cable.
I am going to cut my cable in the next few days....
I'll post the result.

After you cut the cable (leave enough wire from the plug) use your volt ohm
meter to figure out the 9 pin to wire color on the discard end of the cable.

This should tell you what you need to know.

38. [htaprs] TH-D7A for my first radio?

From: "Dobbs, Mike" <mdobbs@amgen.com>
Date: Mon, 6 Mar 2000 14:31:59 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Rendered body type: text/plain

Hello,

I'm studying for my first Ham license (Technician) because I want to get
into APRS. I want to build a transponder for my sailboat (Tornado catamaran)

and have the data routed to the internet so friends/family can follow my
near-shore adventures. I already have a Garmin GPS III+ and have been
researching the TH-D7A as the best overall choice for the project.

Is this unit "too much radio" for a beginner? I know it's expensive, but to
get all the components separately used, I'd still be spending ~$200...with
the additional hassle of all the cabling, less-compactness etc.. This is
important because it's all got to fit into a portable watertight Pelican box
with a minimum of fuss. I feel I can make good use of the TH-D7A on the
water, on the road and on the hiking trails to justify the cost.

I just ordered two units plus their 12volt adapter which they just got, They
also promised to send me a pin-out chart. I'll let you know what I find
when I get the order.

Mike -

> Is this unit "too much radio" for a beginner?

In a word, no. Aside from the integral TNC and APRS software, the TH-D7
is otherwise comparable to other dual-receiver dual-band H-T's on the
market. In fact, there are some notable "standard" dual-bander features
that the D7 is lacking. Noticeably missing are cross-band repeat, and
the ability to tune UHF or out-of-band VHF frequencies on both
receivers. But at only about $60 more than competitive units, the D7
with a 12/96 TNC and APRS terminal is a bargain.

For the primary marine application you describe, the D7 should be a
perfect fit, and it isn't too complicated for the new ham. Prepare for a
substantial learning curve with APRS in general. Get in touch with
existing hams who are active and seasoned in APRS, and ask lots of
questions; and you'll be fine. Because APRS is a relatively new
technology, and still quite evolutionary, you should have no problem
finding fellow hams eager to help.

Good luck with your test and your tracker project!

Rendered body type: text/plain

Some of the APRS status messages I receive on my TH-D7A appear to be
truncated on the HT display. How do I access the rest of the status
message? (I have not found anything in the manual yet that explains how to
access the rest of the status message...)

Bob I agree! I have the GPS III+ and it works great with plotting waypoints
through the D7A. And quell your fears about the D700. The GPS III+ works
great with it, and uses the same cable as the D7A.

Ok. The two wires on the Pharos GPS going to the PS/2 mouse connector are
the yellow and black wires.

The yellow is going to #3 on the Pharos diagram and the black is going to
#4. This is assuming that the diagram is numbered when looking at the pins.

Page 90 of the D700A manual (bottom section) says that the "A" receiver
covers 200 to 300 MHz. However, I was unable to tune outside 136-199 MHz. I
want to listen to a portion of the 220MHz band. Am I doing something wrong
or does the D700A not support this band.

thanks,
Rich Parry, W9IF

Roy -

It's no longer there. Kenwood apparently put D7 owners on notice that it
was a beta copy that would not be available forever. (I don't remember
being told this by Kenwood, but maybe someone does.)

Now you have to purchase it (street price about $55US) with the PG-4W
package that includes the PC to D7 cable.

You need to press the "band" button, which I believe is the Function (F) key
plus pressing the volume knob for band A. Or you can use direct frequency
entry from the mic if you have that turned on.

Rendered body type: text/plain

Two questions:

Has anyone used Skycommand?

Obviously, two radios are needed. I'm wondering if the transporter radio
needs to be a D7 or D700. I suspect that almost any Dual UHF receiver and
TNC would work. I'm considering purchasing a TM-V7A for my shack. Buying a
second D700 seems pricey, considering that I already have a TNC.

Has anyone played with SSTV and the D700?

I wonder if the VC-H1 is necessary to do this. I suspect that common PC
hosted SSTV software would work fine with this radio. I suspect that it
could be wired directly into the VC-H1 connector.

Yes! this was on my long term do list, but Ill never get around to it.
But with all the sleuthing going on, then any TNC and cheap radio should
be able to be the transceiver interface end of the link. And in fact, any
radio can be used to do the SKYCOMMANDING too. THus it will be easy to

set up remote-bases on the hilltop for anyone to use...

ALl we need to do is publish the commands.. which are probably arelady
fully documented in the existing D7/D700 commmand postings...

GO for it. Let us know...

Bob

Yeah, Great if you are just buying one. Not so good if your serial number is
290 and had to be on a wait list to get a D7. This free deal only applies to
new radios! I sent in my registration card when I first got it, like I was
told to do.. So I am out of luck.

 Seems they could have left the Bata software out on the server anyway as
they are now giving away the production bits for free with the radio. Maybe
at a later date they will post the production program on the server (hint
hint).

 The CD has lots of useful information on it I am told, so the CD and cable
might be a good deal even at $55 dollars.

  Kenwood still has the best web site, (Linux powered!) Keep up the good
work! I cant wait for the D7000 radio to come out! I just got my D700 two
months ago.

  Hey I never did get a Hat! hi, hi..

Flip -

> Has anyone used their D7A with a Mirage dual band amplifier (BD-35)?

I use the D7 occasionally with my BD-25 docking station amp. Though a D7
adaper is not available for the docking station (probably because the
battery release is on the bottom of the rig) it does work fine with the
amp using a BNC/SMA adapter. If you want to run the D7 from the shack
power supply, you need to get one of the radio shack or Kenwood PG-3?
cables.

Sky Command works great for us as part of our emergency communications for
the city of Costa Mesa, CA. We use it on low power on a quiet simplex
frequency and have had no complaints. The system IDs itself every 10
minutes on UHF (unlike most cross-band repeaters!) so is legal in that
regard.

The system uses UHF for control (via packet radio) and for the auio to be
transmitted on HF. A 2m frequency is used for the audio coming back from
the HF side.

The ARRL has tried to kill Sky Command by asking the FCC to deny Kenwood's
request for a waiver to allow amateur radio operators to use frequencies
in the two-meter amateur service band to remotely control an amateur
station transmitting on high frequency amateur service bands. The ARRL
made comments to the effect that they were representing their membership,
yet almost no one knew that the legality of the Sky Command system was
even at issue. The date for comments expired before the ARRL even
published anything about it! For a list of comments, look up Docket number
DA 99-2805.

One more thing, Sky Command currently only works with certain Kenwood HF
radios, ones that can be computer controlled, such as the TS-570G. So
don't rush out to buy a second D7A or D700A if you don't already own a
compatible HF radio!

But, as you suggest, the packet control codes used can't be that difficult
to decypher, so I would imagine that anyone could build an interface that
would work with any radio!

62. [htaprs] Two Winners: pocketAPRS 1.05 and D700

From: "hasan schiers" <schiers@netins.net>
Date: Tue, 7 Mar 2000 15:36:06 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69786-2000.03.07-15.35.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm amazed. I was going to buy a kpc3+ to work with my palm IIIx and pocketAPRS, replacing the single port pico-packet that I've run as a dedicated tracker with a Garmin II+ for several years. A local ham (bless him), mentioned that I should take the 180 bucks I was going to spend on the kpc3+, and trade/sell my Kenwood 741 and anything else I had laying around towards the purchase of a D700.

What GREAT advice that was. I got rid of two dual banders and bought the D700 for very close to what I was going to pay for the kpc3+. What a dream rig.

I won't speak to it's internal APRS functionality, because I'm not using it that way. I'm running it as a "conventional" tnc with a computer (read as Palm IIIx) connected to the front panel of the main unit (standard db9 male wiring and connection).

Talk about simple to get going:

1. GPS: Use the supplied sub-mini stereo jack and cable. Splice to the Garmin Data Cable coming from the II+ (RX, TX, Gnd) Plug gps into the D700 and change one menu setting. The default gps data rate and data sentence were as I had already set for my stand alone tracker, so no change was required.

2. Make power connection for radio and gps. (I used cig lighter, as I have for years)

3. Plug Palm IIIx hot-sync cable with null-modem adapter (radio shack) into the D700 db9 connector. (be sure to eliminate all but pins 2,3 and 5 to keep power consumption of the Palm IIIx at a minimum...I just cut them off the null modem adapter.)

4. Set mode on D700 side A to TNC PACKET (not TNC APRS!!). Set 144.390, high power...

5. Execute pocketAPRS (ver 1.05 as of yesterday) on the Palm IIIx. (I did have to change pocketAPRS's computer port speed from 4800 to 9600...the D700 will support no slower than 9600 baud communication between it's computer port and the computer. It will go faster, but not slower.)

Things that are just toooooo slick about the D700 in this configuration:

1. Radio side "A" is now devoted to 144.39 with the TNC. Radio side "B" is

used for all my "normal" fm communication needs. (no matter what freq)

2. All my local repeaters, NWS weather, police, etc are programmed into memory. Either side "A" or "B" can call on this common memory bank.

3. I can be chatting on the local 2m repeater and when the TNC wants to transmit...it just waits...held off in much the same manner as dcd would if the frequency were busy. As soon as I let up on the mike...bbrrrrrrt...out goes the packet...so fast that the voice repeater turnaround is still happening and I haven't missed a peep.

4. The operation of the two sides of the radio (if both are on the same band), is shared automatically such that you get a transparent "feel" as the tnc does its thing while you are either transmitting or listening on the other side of the radio.

5. The menu system is very easy to use, once you understand how to do basic navigation through the menus.

6. The two supplied english manuals are VERY WELL DONE.

THINGS I DON'T LIKE (or would like changed):

1. The mute function doesn't seem to work if you are using TNC Packet mode. (Pressing mute is supposed to mute the speaker of the "half-radio" that does not have the PTT currently assigned to it.). It doesn't work for me and I haven't had any time to play with it to see if both "halves" are running FM voice mode makes it work.

2. Visual scan of memory channels doesn't seem to work on the "B" side when the "A" side is set to packet. It might work...but I can't seem to figure it out. It's supposed to visually scan the memory channels if you are in memory recall mode. I am, I do the keystrokes for memory scan and nothing happens. (This could be operator incompetence.)

3. The manual states that the control head is NOT replaceable. If it is stolen, damaged, or otherwise lost, Kenwood will not replace it at any price, you have to buy an entirely new radio. I'm not sure I understand their position on this, but that's what they plainly state in the manual.

This radio will do so many things that it's downright scary, but setting it up for the basics is quite easy. Memory channel programming and memory naming are very straightforward, as is tone (sub-audible) setting. The ability (with very few and quite obvious keystrokes) to scan an incoming signal for its tone and immediately set your radio to comply is neat... and it works as well for Continuous Tone Coded Squelch and Digital Coded Squelch.

I replaced a very good dual bander, an antenna, and tnc with the D700 (which considerably cleaned up my car), and I have more operational effectiveness than I had before.

And now...on to pocketAPRS 1.05

The changes from 1.03 to 1.05 are numerous and have been posted to the SIG already, so I'll just comment on the two things I like best from that set of improvements and fixes:

1. My mobile now stays as the focus on any magnfication of the map except 64X. I always remain on the map, and my little track droplets show a clear trace of where I have been.

2. A "Find Me" function is available for those times when you aren't watching yourself. One tap on the Palm and the map is redrawn at the current level of magnification with you at the center. Very slick after you have been "mapping around".

The COMBO: pocketAPRS 1.05 and Kenwood D700

I know a LOT of people have been very enthusiastic about the internal APRS capabilities of the D700...and they are, indeed, astonishing. (Very well thought out and comprehensive.) If I had a high-end GPS with high quality downloadable maps and a really nice display, I don't think I would be compelled to use pocketAPRS with the Palm. (Or if I only made short trips and was not interested in messaging much or doing a lot of "map work".) However, since I have a II+ Garmin ver 2.07 firmware, I don't have ANY maps, yet the II+ works very well. Enter pocketAPRS 1.05. I feel nearly as much at home in the car using this fine piece of software. I'm used to flash, and sizzle and functionality up the "wazoo" with WinAPRS. One would think it

would be a big come-down to run any kind of APRS limp-along on a Palm IIIx. Well.....one would be WRONG. pocketAPRS is astounding. It is no crippled imitation, cheap stand-in, or otherwise impostor of the "real thing". It has the feel of WinAPRS...i.e, it is GRAPHICAL in nature and makes rich use of same, to include frequency histograms for heard stations! With its basic functionality I have what I need right in my palm. To a much larger extent, however, I can see, message, count, total, and do all sorts of things that have so cleverly been implemented in WinAPRS (and to some extent it's dos brother).

I had always thought that "mobile" APRS would be a big pain. Laptops are cumbersome and fragile (and expensive). Along comes Kenwood with the D700 and suddenly it ain't so cumbersome and fragile any more, because one doesn't have to have a laptop to get first rate functionality. Internal APRS with the D700 is impressive. Palm based (pocketAPRS) with the D700 is a consummate JOY.

Of course, the D700 IS pricey. That's the downside. That it more than lives up to its pricing, is the upside.

I don't work for Kenwood. I don't work for the Sprouls. I don't work for Bob. I don't work for Mike. I do like their stuff. What fun!

Rendered body type: text/plain

Here are the color codings for the Pharos GPS located at:

http://www.pharosgps.com/product/igps180.pdf

Orange	TX
Brown	RX
Red	Signal GND
Black	VCC
Yellow	Power GND
Shielding	GND

Please note: the folks at Pharos are not certain these color codings will always be used from shipment to shipment. Also, please refer to the pinout diagram posted earlier to this list.

This pinout worked fine for my unit and it has been working very nicely with my D-700A. I would not recommend that you remove the connectors as I did. Build mating connectors to supply power and make the data connections. All you need is a female mini DIN and a male 9 pin serial connector.

Although I did not do it (yet), I recommend you put a momentary contact switch in the power line to this GPS as that is the only way to reset it. I have not needed to do a reset so far.

It's a nice little GPS, very tiny with a 6' long cable. I think it is priced fairly at $125 and makes for a nice permanent installation. It doesn't have all the bells and whistles of a Garmin GPS 35 or GPS 36 but then it is considerably cheaper as well.

Rendered body type: text/plain

The range on my TH-D7A seems very limited. Repeaters I can hit with my
Alinco on low power I cannot reach with high power with my TH-D7A.

Anybody else have this problem? Is there a way to check out the transmitter
on my Kenwood without sending it back to the manufacturer?

Myrt

Yeah. Hook it up to a power meter. What's the output power?

Also, the duck on the TH-D7A is known to be pretty much a dummy load. Use
the same antenna on each radio if possible. That will be a good test as
well.

I replaced my stock D7 duck early on with a thin comet antenna that performs
much better.

Which battery are you using, and how does the output power for that compare
to the Alinco?

Many Ham radio clubs have access to a service monitor or even a simple
SWR/Wattmeter. Either one should give you a indication as to the health of
you HT. Perhaps it's something as simple as the offset not being right or
the CTCSS tone not being selected properly.

The GPS port on the radio works even if the TNC is not set for APRS? That would eliminate the need for
HSP cables.
Can the TH-D7a do this? I was under the impression that it would not pass GPS data in or out unless it
was in APRS mode, which would eliminate using an external laptop with only one serial port, which I had
originally intended to do with an older spare Powerbook Duo. Someone please make my day and tell me I'm
wrong.

** High Priority **

Myrt,

I have three D7A and two of them have had D30 go bad. D30 is a protection diode in the high power
circuit in the D7A. The D7A would transmit in low and medium power but would not transmit in high power.
 This is most likely the problem from your description. Unless you are technically equipped to do this
kind of repair I would suggest that you send it back to Kenwood for repair.

Larry

This GPS runs on 3.5 to 5.5 VDC so what did you use to drop the 12VDC from your car battery? I would like to use the Pharos with my D7 but I am trying real hard to cut the amount of cables, connectors, etc. down to put together a truly portable , easy to carry around, GPS-HT combo. Too bad I can't power the GPS from the HT some how.....

For the D700, in TNC PACKET (non-aprs) MODE, the gps data from the gps receiver is processed by the TNC and properly read by the computer running pocketAPRS on the db9 of the d700. HOWEVER, the positions processed as WAYPOINTS by the D700 are NOT sent out to the GPS for display. Apparently only the incoming data is accepted on the D700 in TNC PACKET mode, and no data is output to the GPS for display in this mode. (And, yes, I do have the proper menu item selected to output gps data ...but it does not function in the TNC PACKET mode.

I get the impression from the responses I've seen so far that the VAST majority of D700 owners are running in APRS mode, and not like I'm using it, in the TNC PACKET mode with a computer (or in my case, a PALM IIIx).

I know nothing about the D7....except when it comes time to replace my 10 year old IC-32at (which is still functioning perfectly), I know what I'm gonna buy!

Hope this helps,

73

Here's a great suggestion (below) I received from KG4ALG.

This worked like a dream. I bought the regulator and a tiny project box
with included PC board at Radio Shack. Wired it up in about 30 minutes and
it's been working great. I too was tired of using a Garmin handheld in the
car due to all of the cables and connectors

I originally wanted to power the GPS from my D-700 but soon gave up on
that. I have a D7 as well but haven't tried to tackle that setup. This
GPS is small enough to velcro to the side of the D7. Perhaps you could use
a voltage regulator off the D7 battery????

dave

To: David Vrona <dave@vrona.com>
Subject: Re: [htaprs] Re: D-700 mini DIN pin out?????

Dave -

While it might be obvious, may I suggest using a standard 7805 3-pin
regulator IC available from RS and a variety of other sources. These
regulators are "a dime a dozen" -- well, more like $1 apiece. Depending
on current requirements, you can use a standard TO-220 plastic version
made to mount on a heatsink, or the 7805L variety in a TO-92 package
that looks like a regular transistor.

Either will produce a regulated +5V from a wide input voltage range. You
don't need any other external components, unless you want to add a small
filter capacitor on the output. The three pins are input voltage, output
voltage, and ground -- couldn't be much more simple.

I seem to remember some discussion about using this scheme to supply the
operating voltage for TripMate GPS's, which normally run on about 6.5V,
but apparently will work fine at only 5V.

Hope this helps...

75. [htaprs] Controlling msgs on D700 with a PC ?

From: "Karl G6ODT" <g6odt@btinternet.com>
Date: Wed, 8 Mar 2000 21:09:10 -0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-69973-2000.03.08-15.11.02--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anybody know if there are any commands that I can use
with a PC control program for the TM-D700 to get the number
of stored messages and to delete them ?

I can display incomming messages to the station callsign of the
sending station and can display the messages as I send them from
the program but can't find away of finding the number in the memory
and removing them.
Also noticed that the AMSG command while it'll show both out going
and in comming messages doesn't show the REJ message that the
radio sends to the other station when the memory becomes full.

One other thing is there any way of getting the packet path of the
incomming message so the path can be changed for the out-going
messages ? As a normal user of UI-View this is a useful way of reversing
the path back to the station.

It sounds like you are thinking along the same lines that I am. I'd like to
use the TM-D700 in APRS mode, but have the ability to connect an external
terminal for displaying, managing, and sending messages. I have not been
able to determine how and if this can be done. I suspect that it can't be
done. This implies that the serial port has no function when in APRS mode;
a pitty!

There are a number of reasons that one would want to operate in this
fashion. My main reason is to avoid using a big notebook in my car. My PDA
is not a Palm-Pilot. A second reason is to avoid conflicts with my serial
port.

Anyone out there have any suggestions?

Yes,

A small keyboard to send messages from the D700 (hey even the D7) is
needed. How about this idea, A key (as in cw) that you plug into the radio
to send messages, no hate mail please. Even cw would be faster to send that
trying to deal with the Mic or keyboard when you are driving!

Just a thought to get people thinking about how to send messages.

> a voltage regulator off the D7 battery????

 I just got my D700 yesterday and had it up and running last night ... this
afternoon I sat down and straightened out the kluge of wiring (my old
'mobile' setup was a D7, Garmin II+, and a brick, sharing console sapve with

TM261A , two antennas, etc .... aaaarrrggghhhh!!!!!).

What I did was terminate the Garmin data cord in a DB9 male with the
datawires to 2, 3 and 5, and power to pin 9. I then made a short cable with
the Mouser cord with the 2.5 mm plug set to 2, 3, and 5 of a DB9 Female, and
a piece of red/black 18 ga zip cord to pins 9 and 5. I then carefully tapped
the heavy red/black power wires from the D700 just above the two prong power
connector. I put an in-line .5 amp 3AG fuse/holder in that line too.

Now I just have a simple plug in for the GPS, one wire. I am also running
the entire power for the GPS and D700 through a Radio Shack 20 amp
automotive interference filter (I had had it in place for the D7 and figured
it can't hurt the D700).

It is actually very easy to do with a PIC chip and a DTMF encoder. Just
convert the keyboard characters to Touch tones (thats how the letters you
enter already on the Mic Key pad get into the radio already...) I posted
this a month ago, so I hope someone is working on it...

Bob,

 I hope so also, I have my soldering iron and check book ready! I really
like the idea of a ASCII keyboard or cw key as the input device. I know that
the bicycle mobile people have a way to special way to send messages while
on the road. I think they use two push buttons on the handle bars.

Received my PG-4W cable and MCP-D7
CD from Kenwood today.
There's an informative 20+ minute "movie"
about the operations of the THD7 on the CD.
Nice job Kenwood.

Jerry - WW0E   -   ww0e@juno.com

I have installed and re-installed the Kenwood D700 software
for loading/unloading the D700 memories, but everytime I try
to execute it all I ever get is an "invalid radio" message.

I have checked all the connections, turned power off before
connecting the radio and followed all the instructions as far
as I know.

Has anyone else had this problem?

Fred,

 Run a terminal program on your computer. Use the com port and cable to your
radio. Put the tnc into packet mode. Set the terminal program to 9600 baud
and correct com port.

At this point you should see the CMD prompt from the tnc in the radio.

If not (and I suspect this is your problem) you have a com port problem on
the computer . You can check to be sure the cable is not the problem by
jumpering pins 2 and 3 on the com port and typing on the computer key board
(it should echo). If not make sure the com port you are using is good.

I am really pleased!

I posted my problem message about 2 p.m. and within ten
minutes I had 3 replies! The problem turned out to be
the D700 was in TNC mode when I was trying to access it.
Once I turned off the TNC mode, it worked fine.

Thanks to all you helpful guys -- this is a real impressive
list....

A twenty minute Movie on the CD :**(I wish Kenwood would
retroactively give the guys who supported them in the beginning at least
the opportunity to get the CD for the asking. I'm sure most everyone
already made the cables so they wouldn't have to send them. I have the
literature but never downloaded the program, silly me.

I tried sending a msg tonight from my D700 with the address line
having only EMAIL in it for internet access..

Worked - very impressive.

How long a message can I send?

Thanks, I'll give that a try.

I noticed the msg length in the D7 is considerably shorter.

BTW - Has anyone figured out how to delete Messages in
the D7 ????

 We really need a D7 and D700 FAQ - the answer to this question - asked by
every single new D7 owner, I might add - is that _you cannot_ !!!!! they did
fox that in the D700, you get 16 messages and you selectively delete them,
on the D7 you get 10 and they simply scroll off.

Rendered body type: text/plain

We now have a number of TH-D7A owners in the Mount Gambier area of South
Australia.

All are having problems with the MCP D7 programing software (version
0.01 beta)

(1).   Instructions from computer to enable AM mode in airband are
ignored. Although AM mode selected form the handheld keyboard are
correctly read by the computer.

(2).   Instructions from the computer to programme DTMF code memories
are ignored and not uploaded to the handheld.

Has anyone else seen this problem and/or found the solution? or is
there a later version of the software?

Many thanks de Kevin VK5KJ

I second that. I've purchased 4 of them, and Larry's share(hard)ware
concept seems to work very well for small items like this. (And he builds
other cool stuff, too. Try to take the time to read about his funicular,
and home made gas turbine.)

Chris

Hey, Doc -

I haven't tried the aircraft band presets idea or DTMF memories, but it
wouldn't surprise me. Kenwood was fairly open that the software on their
FTP site was a beta version, and all risks were the user's. The only way
to get a later version is to buy the PG-4W kit with the CD-ROM.

The beta is what it is, and it still makes programming the FM presets
much easier than typing them in by hand.

96. [htaprs] D700 "LIST" labels????

From: "Brian B. Riley" <brianbr@macconnect.com>
Date: Sun, 12 Mar 2000 13:57:13 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-70648-2000.03.12-12.56.28--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK, I have been on the road with my D700 for five days ... one question I
have is the labels in the "LIST" display.

 THD7, D700, FIXED, WEATHER, STATUS, GOOD/GGA, GOOD/RMC, MOVING, Mic-E -
pretty much all self explanatory.

 ID - what does that mean?

Why does a given station get GOOD/xxx and another simply get MOVING ???

What about moving D700/D7's I am sure they outnumber fixed position units of
either type.

I just don't get the subtleties. Anyone have any idea about what the logic
is behind the labelling?

AN ID packet
>
> Why does a given station get GOOD/xxx and another simply get MOVING ???

I think Kenwood chose "@" posits to call moving.
I preferred that they actually confirm a SPEED before they call it
moving.. But it didnt make it into their code...

Lots of possibilities here. They could have shown WIND for stations with
non-zero wind speed, otherwise shown WEATHER for weather stations. Lots

of possibilities...

98. [htaprs] Marathon Lessons?

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 12 Mar 2000 18:15:10 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-70671-2000.03.12-17.14.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Did an APRS marathon today. Its all 26 miles on an old railroad paved
bike trail. Cars can only access the trail at about a dozen crossings...
THought you might be interested in seeing some thoughts and lessons...
(Any comments here are *NOT* meant to criticicize, only to learn...?
Great set of volunteers, they do great work. Read this for fun! and
humor...(tongue in cheek)

PLAN: No one ever asked for APRS... but the last week, I just sort of
"volunteered"... With my THD7's what could be easier?.. So this is kind
of an outsider's view...

TRACKERS: I brought 3 THD7 trackers and enough duct tape to put them on
the chase bicycles (remember the first time in 1993 when I did this with 3
full size MFJ TNC's and 50w radios on the bikes!)   (In APRSdos hit
FILE-REPLAY-RUNNERS to see this classic)

NET CONTROL: I brought one THD7 and 4 old DOS laptops (with 2 conductor
ZIP-cord connecting them all to the same THD7). Intending one for each
voice radio operating position (and one for me).

My plan was to set one laptop to autotrack the LEAD, one the TAIL and one
whatever was of interest at the time. By doing it this way, there was
always a zoomed-in view of the hotspots and no one had to jump around on
the maps very much (which takes over 6 seconds on these old 8186's). And
this way no one had to be trained...

OPERATIONS:

* The NET CONTROL Ops had said they would operate from the tailgate of a
pickup and would have AC. But then at 6 AM decided to just operate out of
their cars, and so no-need to set up for AC power.   (Fortunately
Everything of mine would last at least an hour or 2 until we could find
the school janitor to unlock a window)...

* Having invested 6 hours in preparations, I was still going to play with
my toys, so I hoisted my 40' fiberglass fishing pole antenna and set up
three laptops on the tailgate (with the trackers all at my feed). THus, I
could see everything (with nothing moving), and hear nothing. Likewise,
the voice operators in the cab of the truck could hear everything and see
nothing. Interesting arrangment... (remember, I was just a
come-as-you-are)

Well, with the lead runner about 30% into the run, things started getting
confusing. No one knew where the TAIL was, or where the "real" lead was
(the Trail is not closed during this event. Any locals can still jog
along this very popular Jogging trail. So you have 700 Marathon runners
and probably that many other regulars)..

I did learn of one VIP vehicle that was supposed to have a HAM in it to
shadow a Race Official. So I Ductaped one THD7 and GPS to it. It
promptely was driven a mile away and parked for the next 6 hours...

They kept asking me where things were (My remaining 2 tackers were still
in the bag at my feet and my laptops were surrounding me in the back
entertaining myself just fine). Fortunately, I was keeping an estimated
LEAD and TAIL being deadreckoned on the map and was of some use. Then a
school kid showed up and he was fascinated with my laptop, so he squeezed
into the cab with the laptop and now there was something to see. (I had 50
feet of zipcord for just this purpose)...

Next the Ham with the Bicycle at mile mark 9 (After everyone had passed
his position) decided he could fill in as tail-end charlie, and I dashed

out there to show my expertise with duct tape. Great, now one real moving GPS object on the map... (and one in a parking lot)... Interest in the laptop display was growing in the front seat of the (sub compact, imported) pickup... Gosh.. it works...

Then a D700 drove up and agreed to shadow the bicycle acting as a mobile RELAY through the north end of the course. Now things really picked up. As the bike and mobile relay moved through the "black hole" where none of the voice operators were ever able to communicate, (mile 18 to mile 23) they tracked the bike just fine....

Now they were impressed. And soon the voice net succumbed to the usual APRS back up comm channel as you heard things like.....

REPORT: "This is mile mark 18, we have the lead runner in view!)

NETCONTROL: "Yeah... we know..."

REPORT"   "This is mile mark 19, We have the lead runner (or at least its the first person we have seen with a number on his shirt)...

NETCONTROL: "Yeah... we know..."

etc...

LESSONS: None really, all the voice ops did their usual fine job. There were no incidents, casualties or injuries. APRS was fun... But I guess two things might be worth mentioning.....

1) My idea of doing an event is to set up a NETCONTROL that the public can see. It should LOOK like radio. Look professional.. Have a SIGN. The public should be able to SEE that there is such as thing as HAM radio. Not just some guys sitting in their car... (Yes, sometimes you do want to put them in a room out of sight so they can concentrate on their JOB, but this was probably not one of those kinds of events)...

2) Two other Kenwoods did show up, but with no other bicycles to track and these systems being integrated into CARS (which could not go on the bike trail or anywhere near it) we never really could use them. The one D700 though was great as a mobile digi...

(Remember I actively do *NOT* push APRS locally, since some would think it self-serving)... But we have done this particular Marathon at least 4 times now, since 1993, and all though you would think it should be getting easier with the new toys, it still seems that the other 25 volunteers that do these kinds of things in our club, still dont get excited about APRS at all..

Oh well.... At least I have fun.... :-)

MORE DETAILS... Only if you like using OLD laptops:

Yes, even though I now have a few 386/486 and/or color laptops, I still find that the old LCD CGA Zenith Laptops are the only thing you can see WELL in the sunshine... (I dont have an active crysal color laptop nor would I want to put one in the rain if I did...)   I actually wanted to prove it to myself that they were still usable. By editing the APRSdos map of the marathon and eliminating everything outside of the immediate venue, I got the map-redraw down to about 6 seconds on the supersport and about 12 seconds on the 8088's.

The night before, I found that Configuration of all the detials was Maddening at these slow speeds. Finally I quit and just configured my 486 Laptop to exactly the right setup (easy to do at that speed). THen just copied the CFIGxxx.APR file to the clunkers so that they booted up perfectly to the desired configuration.

At the event, with the muiltiple views of multiple laptops, the delays were there, but quite tolerable. You could look at somethign else while waiting for one of the others to update...

P.S. I typically will buy these when the get to $20 at hamfest, though I have paid as much as $50 for my first one back in 95...

Oh yes, I did a MAP-LOCK command to make sure it never tried to reload any other maps (takes 40 seconds from the HD)....

NOTE! If your EVENT ALL FITS ON ONE MAP, you dont even need a hard drive! Once you load the map from the Floppy, and MAP-LOCK it, APRSdos will not

need anymore files and so will run just as fast on a FLOPPY only system as
on one with a HD. So using old-slow laptops even with out a HD is
entirely possible.... We still do it on the sail boats at the naval
academy every summer with only 720K floppies, since they only draw 250 ma
24 hours a day... (we dont do this because we like it, but becuse they
wont buy us anything else. We have 18 of them!)

Rendered body type: text/plain

Someone had information about the SMA to BNC adapter that
had a cable pitail connection between the adapters to reduce
possible damage to the antenna connection on the board. As I
recall, these were from Radio Shack. My RS can't find them, and
there is no reference on RS's online catalog.
Does someone have catalog numbers or an alternate source for this
item?
Thanks.,
Jack, WF8X

I got SMA to UHF at D&L Antenna Supply. See:

http://www.wavehunter.com/consav.htm

This is their "Connector Saver" which is an SMA to UHF with a couple feet
of RG174 between. Looks like they have other connector combinations too.

101. [htaprs] LOST THD7 Recovered..!?

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 12 Mar 2000 22:27:39 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-70705-2000.03.12-21.38.26--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well, not really, but it could have been...

Here is the scenario...

After todays marathon, After I had cut the duct tape and removed the
THD7/GPS from the chase bicycle. I had a few more minutes and decided to
drive down an unmapped road and take some GPS readings so I could
add it to the map for next year.... Done...

Tonight, 8 hours later, I decided to replay what my home station had
captured during the day. Everything was there, but then there on the
last file was the strangest thing. I could see where My VAN had
merged with the tail bike, where I removed the system, and where I
then proceeded up the obscure road..

Strangest thing... The TAIL bicycle must have followed me. I didnt
think he lived up that way. Checked it out, and no, he lived the
other way.   Hummh... what was I seeing?

I had removed the THD7/GPS from his bike, piled them in the
car and had even disconnected his handheld GPS so that I could put
it in a bag to take back to work. But Now I remember that when I
got home, I found his THD7 (placed inside an aluminum ZERO case)
had been left on..

Silly me! Vicinity Tracking! My van had its D700 set with UIDIGI
ON and set to RELAY (to help out along the course). SO when I
placed the THD7 in the car, with NO GPS, it reverted to 0000
Positions. And of course, APRSdos will then attempt to Vicinity
Track that signal to the nearest DIGI. WHich was my van!
Thus, the THD7 hidden inside an aluminum suitcase inside my van,
with no GPS was appearing to follow behind my car in the history
file.... Interesting...

Now extend this to a lost KID, or stolen suitcase, OR whatever...
Remember, EVERY recent KPC-3 or D700 on the planet has UIDIGI
Callsign substitution BUILT IN. Thus anything that is transmitting
any kind of packet, that passes by any of these radios can be
traced to that location.

Now, here is the cheap-plug (yes I do have a conflict of interest here)
But here is how small you can make such a (non-GPS) tracking device...
with ANY TNC...

   MIM Module. (or any TNC) Generates AX.25 packet
   10 mW Key Chain 433 MHz XMTR ($24)
   9v Battery.
   Size: about twice the size of the battery itself
   Life: about 48 hours.
   Cost: about $100   (Less in quantities)

For the next marathon, rather than having mobiles, you could almost put
these trackers on a few runners and then put D700's along the route
and you would see these runners get plotted everytime they passed a
checkpoint! Use one of the tiny 12v key chain batteries and make it
HALF as big.

You see why I get excited about vicinity tracking!

de WB4APR, Bob

Oh, by the way, the "vicinity" is variable. If the packet
contains a number in braces "{###}" APRSdos will plot the vicinity
plot within that number of 100's of feet to the nearest digi. Or
by default, witihn 1 mile if no ### is given... By setting # to 1,
then, was how I was going to track people indoors at Dayton within
100 feet of each room that had a BOX-N digi in it (a deaf digi that
would only hear to 200 feet).... but that's another story...

Wow, this year at dayton all we need is 7 D700's in the seven halls at
Dayton to track everyone indoors! But thats another story...

102. [htaprs] Tweeks to WXSVR Output

From: "Dale Huguley" <kg5qd@worldnet.att.net>
Date: Mon, 13 Mar 2000 12:39:43 -0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-70765-2000.03.13-06.39.44--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All-
    I finally joined the D700a club and have been putting it through its paces. Had some surprises with how it reacts to output from my wx parser. I had intended for the packets that contain the area data that lights up counties/zones not to show up on the d7/d700 - would not be easily read. However I ended up adding the full name of the county or counties at the end of the packet and It works very well.

    In order to do this I had to go to a fixed 6 character format for the type of watch or warning so:
TORNDO   =   Tornado
SVRTSM   =   Severe Thunderstorm
FFLOOD   =   Flash Flood
MARINE   =   Special Marine

This is set so that a warning for one or two counties will have the full name or names - more than that won't fit --so no names.
Now there are two levels of information- at the county level and (if it can be parsed) a more specific
place which will display on a mobile/ht rig.

Examples:
GRBSVR>SKYW:NWS-WARN :090110z,SVRTSM,WI_C073, MARATHON COUNTY {90LAA
GRBSVR>APRS:NWS-WARN :SVR OVER MARSHFIELD {90LAC
GRBSVR>SKYW:NWS-WARN :090135z,SVRTSM,WI_C115, SHAWANO COUNTY {90mAA
GRBSVR>APRS:NWS-WARN :SVR mov NE @30 15 SW   of SHAWANO {90mAC
GRBSVR>SKYW:NWS-WARN :090055z,SVRTSM,WI_C135, WAUPACA COUNTY {90OAA
GRBSVR>APRS:NWS-WARN :SVR mov NE @30 15 NE   of WAUPACA NEAR SYMCO {90OAC
GRBSVR>SKYW:NWS-WARN :090140z,SVRTSM,WI_C087, OUTAGAMIE COUNTY {90rAA
GRBSVR>APRS:NWS-WARN :SVR mov NE @30 10 W   of APPLETON NEAR DALE {90rAC
GRBSVR>SKYW:NWS-WARN :090045z,SVRTSM,WI_C097,WI_C137,WI_C141,   {902AA
GRBSVR>APRS:NWS-WARN :SVR MONTELLO TO BABCOCK AND NEILLSVILLE {902AC
GRBSVR>SKYW:NWS-WARN :090005z,SVRTSM,WI_C097,WI_C137, PORTAGE & WAUSHARA COUNTIES {8NLAA
GRBSVR>APRS:NWS-WARN :SVR mov NE @30 05 SW   of PLAINFIELD {8NLAC

Winaprs seems to ignore the county names (they are not in the SS_C001 format and also have a leading space.)

On the D700a it is VERY clear for what county the warning is for.

104. [htaprs] D700 digital noise problem

From: "Richard Carter" <rich.carter@windriver.com>
Date: Mon, 13 Mar 2000 13:34:09 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-70818-2000.03.13-12.33.08--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have twice received bad signal reports on my D700 tranceiver. Both times,
there appeared to be "digital" noise in my voice transmission. The TNC was
turned-off both times. Once it occurred on the 2m band, the second time on
the 440 band. I didn't hear the problem, but it was described to me as
sounding like the TNC was transmitting. I have not been able to recreate
the problem. I can't send it back for repair if I can't recreate the
problem. My suspicion is that it has something to do with the control
channel.

Has anyone else experienced similar problems. Any ideas?

> Did an APRS marathon today. Its all 26 miles on an old railroad paved

Marathon? Is that a euphemism for buying six dozen THD7 !! :)

Interesting account Bob. If I tried such a thing half the connectors would
go open circuit and all the laptop batteries would fail - but it does
show the usefulness of APRS - and how it might be applied to say a mobile
rally talk in too.

Your other bit on vicinity tracking is also fascinating. People dont
NEED a gps to take part in mobile experimentation at all. Just a TNC and tx.

 I have had a comment from one person that they thought they heard some
digital "in the background' at the beginning of when I came back from
'dropping out' (APRS side A takes precedence over the voice side B if your
are talking when it wants to transmit) in the middle of a transmission.

Jack,

I use a small pice of semi-rigid with SMA Connectors on both ends I bought
at a ham fest last summer. I bend it up and put the ruber duck on it for
hand held operation. When in the truck, I bend it down to hook up to my
external antenna. the semi rigid clips under the belt clip and takes the
stress off the SMA connector in the radio.

You should check the semi-rigid to see that it is 50 ohms and
works at the frequenies you want to use. I have access to an
impedance analizer at work and checked my piece at lunch one day. ;-)

That's incorrect. If you are transmitting on side B, side A on APRS will
WAIT until you release the microphone in order to transmit. I watch it
happen nearly every day.

 hmmm, well I thought that that was the way it should be, but what else
explains the dropouts I have heard and had reported. Aside from this it
works great.

Well, the dropouts you have HEARD are different. If you are listening on band B and have the DCD sense set up for band A only, the APRS side WILL transmit when you are receiving a signal on band B. If you put DCD sense on both bands, it won't transmit unless both bands are quiet. I have DCD sense on for band A only. That way if my local repeater is tied up with guys having a rag chew, I'll still transmit packets. The dropouts I get when I am in QSO with someone are short enough that it doesn't really bother me.

What I don't understand is why it has to drop out. I can transmit on band B on voice and band A still receives fine. The radio is capable of full duplex operation. Must be something to do with the TNC or what not.

Now, as for why others might hear you drop out, I know that one problem I have is with keeping the mic button pressed. For whatever reason, due to size or whatever, I have a hard time sometimes keeping the D700's mic button pressed. Seems like it is fairly sensitive to pressure and if you don't have it held down firmly, you'll stop transmitting. At least that's what happens to me.

112. [htaprs] D700 mic audio gain adjustments?

From: "Todd Ellis" <ellistr@booth-assoc.com>
Date: Tue, 14 Mar 2000 07:33:56 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Anyone have a chance to adjust the mic audio level on the D700? I'm afraid to poke around with the mic gain (wherever it is, not mentioned in the manual at all) since I have seen several other radios from other manufacturers use a single gain pot for all audio, including CTCSS (and in this case, data?). Any input would be appreciated by this chronic mic-mumbler.

Todd Ellis, N2XL

Because the mic audio is low. I have to be right up on the mic speaking
loudly and clearly in order to be heard and understood well.

Again, any insight on adjustments before I start tweaking?

Rendered body type: text/plain

The problem I reported occurs when the TNC is supposed to be turned off.
Both channels are in voice mode. It is not just at the beginning or end of
the transmission. It is during the entire transmission interval. I'm
getting suspicios that I may have accidently pressed the control button. I

don't really know what this does. I think it has something to do with
skycommand, which I can't play with unless I buy a second radio (ouch!). I
guess nobody else has had the same problem.

I have no problems with my microphone key or audio level. It sounds like a
problem with your mic.

Thanks for comments

There is no problem with my mic; others on this list are now also voicing
their concern about the audio level too. Please don't be so quick to
eliminate the problem as a bad mic - it works fine, just the audio is a bit
low.

Again, anyone have any insight on mic audio adjustments?

Jon,

Here is the problem I see with my D700, no one answered this (not even Kenwood) when I sent it out on 2/14/00. I have my tnc on the "B" radio so the problem seems to be an audio switching bug. "A" you get data "B" you get dead air. Notice I get dead air not data. Kenwood, Kenwood please read and test this out.

from message sent 2/14/00

I hate to report that I have discovered a problem with my D700.

Here is the failure mode:

The APRS beacon is transmitting on the "B" radio. At the same time I key the Mic to talk on the "A" radio, At this point all is well the packet data goes out the "B" radio just fine. When it is finished transmitting the "A" transmitter keys up (I still have the Mic key down) and I am talking into the Mic. Users on the repeater tell me that all they heard was a dead carrier. I have to wait until the transmitter is done on the "B" side then key the "A" side to be heard. When you are driving it is not possible to look at the radio to see if the "B" transmitter is active, so many times I transmit dead air.

Any one else see this problem .

Richard,

 Yes, both transmitters are on the same band. "A" is 146.640 repeater and
"B" is 144.39 APRS.

Hi Rick

There are only a few of the 700's here in Albuquerque and two of them I
have heard with a similar problem. It's almost the first cycle of a
sweeping siren sound. It's a tone that sweeps up in frequency every time
the rig is keyed untill it gets warmed up a bit. Neither of them were in
a packet mode at the time but were being used as conventional dual
banders.

It appears once the rig has transmitted a few times, the sound goes away.
 These sounds do NOT sound like a digital noise, at least the 1200 and
9600 baud packet noises I have heard. If you have ever heard an aircraft
ELT signal, it's like the first cycle of one of those.

Any other reports??

Hi Jon and other D700 owners

If you take the microphone apart you will see they have a 'sponge'
between the mike button and the microswitch inside. It's really
incredible!! I took the eraser off the end of a wooden pencil and
trimmed it a bit and hot glued it into place. No more problems with
talking and hearing the repeater courtesy beep go off while I'm still
talking!!

That's not it. The control button allows you to change the frequency and
other parameters of the NON-PTT VFO. In other words if you are listening to
one repeater on band A and want to change repeaters, functionality or
whatever on band B while still being able to transmit on band A, you press
the control button. This will allow you to transmit on A while messing with
B. A nice feature if you are trying to work UO-14 or one of the other FM
satellites with the D700.

 that is funny, my audio is almost the opposite. a couple of locals have
told me to climb back out of the mike, I am now holding the mike about 3-4
inches farther from my mouth than the very same mike (sans the letter
markings) which I was using on my TM-261.

The radio should NOT transmit on one band if it is transmitting on the
other. I'll test it out, but it cannot transmit from both VFOs
simultaneously. It is a weird problem.

Does the same thing happen if you reverse the bands (A data, B voice)??

More information:

Both transmitters are in the same band. "A" is 146.640 repeater "B" is
144.390 APRS

        "A" will NOT transmit until "B" is done sending data (as it should).
But if you key the Mic while the "B" transmitter is sending data and hold
the button down, when the "A" transmitter comes up you will have no audio.
Why is this problem? When you are driving it is not possible to look at the
radio to see if the "B" transmitter is active, so many times I transmit dead
air.

I have not tried revering the A and B voice data. I will try and
do this at lunch today, The radio is out in the parking lot, WB9TLH-9 .

Other have just removed the spring and let the sponge do the job. It works
too, but has a rather different feel. Another solution might be to just
remove a coil of the spring so it is less forceful. I haven't tried that
one yet. But to answer another question, yes, people frequently tell me my
modulation is a little low. Most mobile rigs coming from Japan have their
mic gain control set way high. It was explained to me once that the reason
for this is that, in Japan, it is illegal to talk on a radio while
driving, so everybody holds the microphone on their lap while talking!
Don't know how true that is, but it's a good story! :-)

Does anyone have a schematic or a description of what each coloured wire
represents to the radio.

The above is used for a Icom Handheld and i wish to use it for a Alinco.

thanks

Hi Julian and the SIG

If you look inside, at least in the several we currently have in
Albuquerque, there is NO spring!! Only a sponge like material and so the
end result is you can push the mike button to the stop, but the sponge

gives way and the transmitter unkeys!! Only by releasing the button and
letting the sponge return to it's uncompressed form can you get it to
rekey the transmitter. Thus the use of a harder material, such as the
pencil eraser, overcomes that problem and let's you talk more than a few
seconds.

C U all

132. [htaprs] APRS/CE Beta Release...

From: "Rob Wittner" <rmw@rwa-inc.com>
Date: Wed, 15 Mar 2000 22:22:56 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-71366-2000.03.15-21.20.13--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRS/CE (APRS[tm] for Windows CE) v0.99.597 (Beta) has been posted to:

ftp://ftp.tapr.org/aprssig/wince/

You'll see a file called APRS-CE.EXE in that directory.

This is a Windows 95, 98, and NT/2000 .EXE that self-extracts and runs SETUP
for APRS/CE.

Just a reminder: this beta will expire on May 22, 2000. I'll have to have
something newer out before Dayton. :-)

Some important things:

*** IMPORTANT THING #1 ***

BEFORE YOU INSTALL THIS APP, BACK UP YOUR WINDOWS CE DEVICE!!! (PLEASE!)

Sorry to shout, but if the install gets completely buggered, the only thing
I'll be able to do for you if you didn't back up is sympathize with you.

I've never seen or heard of anyone's machine (including my menagerie)
getting hosed by this install, but I'd hate to have it happen to someone
without a backup.

I've installed the thing on my personal day-to-day Casio E-100, and my
clean/fresh/hard-resetted IBM Z50, HP Jornada 420, and HP 320LX (upgraded to
WinCE 2.0) and all worked great. I installed it on a colleague's Z50 (he's
got tons of third-party software on there) again without incident. I've
also received reports from early beta testers that all went OK on their
machines as well.

*** IMPORTANT THING #2 ***

Some of you will go out there and go, "TWO MEGS! Jeez, how big is this
thing?!" Relax, the only reason it's two megs is because there are ten
separate builds in there:

Handheld PC w/ Windows CE 2.0 SH3 (HP 320LX) Clamshell grayscale
                "   MIPS
Palm-size PC w/ Windows CE 2.01 SH3 Palm-size grayscale
                "   MIPS (Casio E-11)
Handheld PC Pro w/ Windows CE 2.1x SH3 (IBM Z50) Subnotebook and clamshell
color
                "   MIPS
                "   SH4
                "   StrongARM (HP Jornada 820)
Palm-size PC w/ Windows CE 2.11 SH3 (HP Jornada 420) Palm-size color
                "   MIPS (Casio E-100)

The two-meg file will sit on your PC, but only the files that are relevant

to your CE box get copied down. For most installations, APRS/CE will only
take up 350K-500K of storage space, *not* two megs.

*** IMPORTANT THING #3 ***

If you're not using ActiveSync 3.0 to connect with your CE box, go get it!
Right now! It's free. I'll wait. :-)

To get it, go to:

http://www.microsoft.com/downloads/

Choose Windows CE as the operating system and click "Find it!"

I see two different ActiveSync 3.0's in the listing -- just to be safe, pick
the bigger one. (I downloaded it and stuck it on a CD-RW long ago, so I
don't remember which one I grabbed.)

*** IMPORTANT THING #4 ***

I would really, really, really appreciate it if:

(1) You could go download my .EXE when it's convenient.
(2) Let me know that you are downloading it.
(3) Back up your CE box.
(4) Attempt an installation.
(5) Let me know how it went, *** especially if it didn't work! ***
(6) Give me feedback on basic operation.
(7) Let me know what features currently aren't there that you'd like to see.

*** IMPORTANT THING #5 ***

There are no maps included with this installation! (I felt that a two-meg
download was big enough.) Feel free to use any Win/MacAPRS, pocketAPRS, or
dosAPRS map and place it anywhere on the device, in any directory. (The
startup routine searches the entire filesystem for maps. If you add maps
while the program is running, use the File->Refresh Map List menu option to
rebuild the map menu. You can also do this if you pop in a flash card with
maps while APRS/CE is running.)

*** IMPORTANT THING #6 *** (Last one!)

If you find a bug, report it. Even if you think someone else has reported
it, report it anyway. I will be tracking them all, but if I never hear
about it, I can't fix it.

Thanks in advance for all your support, and I hope that I am nearly finished
with delivering something that folks will find useful.

Left Brain/ Right Brain story... or stoopid me....

Since I began listening to the satellties with my D700, I have just left
it on one of the downlinks so that if the satellite comes into view, I may
per chance hear it. But rarely does this occur, and then only when I
happen to take a look at APRStk before leaving in the morning or evening
so that I remember when to take a listen...

Tonight, after 3 months of this, I was driving home and looking at the
front panel of the radio and thinking the chance of a satelltie in view
right now is 1 in a million, so out of boredom, i thought, why dont I just
switch back to 144.39 to see what is happening this evening....

No sooner had I done this then that KO23 popped up on my front panel! It
was 2240 miles to the south with -8 KHz doppler.   About that same time
another D700 user that must have been mobile at the time SAW my D700
posit come on line and so he called me on the local repeater and asked if
I was hearing KO23...

I was dumbfounded. I never thought to just monitor 144.39 for the
satellite passes SINCE IT IS MY HOME STATION RUNNING APRStk THAT IS
PUTTING THEM THERE! Of course that is what I designed it to do! He was
surprised at my surprise, since he said that that is how he has been
listening to the satelites, by just waiting for them to appear on 144.39
and then QSYing... My APRS satellite objects even show you what freq to
tune in!

But somehow my brain never connected that fact that I TOO could use
this data. But there as an APRS object on the front panel of my D700 was
evverything I needed to know:

1) KO23 was in view (otherwise APRStk would not be transmitting it)
    (Thanks steve for making me kill them when not in view)
2) The TIME stamp showed me the object was less than a minute old
3) Ignoring its LAT/LONG, I could see that it was 2000 miles to
    the South
4) It showed the satellite's freq was 435.170 (so I could tune it in)
5) It showed me that the doppler was presently -9 KHz (so I could add 10)

Wow, Why have I wasted 3 months over listening to a closed squelch on
435.125 hoping for a satellite to pass in view, when my home station was
telling everyone including me (with only my D700) exactly when a
satellite was in view!   Wow, talk about a void between the right brain
and left brain! I guess I was just so used to watching the APRStk map
screen at home as my source of satellite data, I forgot that it looks
GREAT and is so informative on the D700 display too..

Bottom line. If someone is running APRStk in your area, then you can
cruise around with 144.39 playing APRS but when a satellite comes into
view, you will see it and can QSY and not miss a thing.   Wow, it works!

THis new version of APRStk adds a new capability to convey to local
mobiles with the THD7 or D700 when satellites are in view. Once every 10
minutes it can transmit a DX SPOT that will be captured on the DX list in
the Kenwoods (or any version of APRS). This DX spot will contain a list
of up to 5 satellites that will be in view in the next 80 minutes.

The existing APRStk would only transmit Satellite Objects when they were
actually in view, but it gave mobile users no "heads-up" that there may be
a satellite soon to come in view. Now, just check your DX-LIST every now
and then to see the schedule.

Thus, THD7/D700 mobiles have no need for any satellite tracking software,
yet they will be alerted on 144.39 whenever any workable mobile satellite

comes into view (as long as someone in the area is runnning APRStk). The front panel will show them any Satellites in view, or the DX list will now always have the next 80 minute schedule! There are 7 satellites of interest (UO22, KO23, KO25, TO31, UO14, AO27, SO35). The last three are workable using FM voice and we are lobbying the AMSAT community to eventually turn on one of the PACSATS for APRS digipeating. In the meantime you can monitor their 9600 baud downlinks and start getting experience...

APRStk runs in an APRSdos environment. If you dont have that, then download the whole thing in APRStk.zip. If you already have APRSdos, then all you need is ASTK-EXE.zip. Be sure to install it with PKUNZIP -d or WinZIP.

Download from ftp://tapr.org/aprssig/dosstuff/APRSdos/astk-exe.zip

NOTE: This is a lot of stuff packed into one program. It basically has 3 separate and distinct uses and some conflicts:

1) Use it with a THD7/D700 as an automated Satelite monitoring station to control your radio for listening to the 5 digital and 2 or 3 analog sats.

2) Use it as your home station with ANY radio/TNC on 144.39 as a way to keep an eye open for satellites and/or to UPLINK on 144.39 these satellites as OBJECTS to everyone in your area so they wont miss out on the satellite fun. (Run out to your car to work the pass with your D700). This base station operation also now sends out the once every 10 minute DX spot satellite schedule.

3) Use it as your APRS mobile Satellite Ground station when hooked up to a D700 (not a THD7 which cannot operate crossband 9600) for operations through any (yet to be determined) APRS digipeating PACSAT.

CAUTION: If you try to operate #2 as an APRStk feed to your local area, do NOT use a THD7 or D700, since APRStk will be trying to do 2 things at once. When a TRACKED satellite comes into view, it will FIRST QSY the radio to listen to the satelite, so therefore it is NOT on 144.39 to be able to transmit the satelites as OBJECTS for others.

I will fix this, but it will take some overhead, so for now, do one or the other but not both. If you must use a THD7/D700 in the role of an OBJECT uplink base-station then configure APRStk and tell it you are NOT using a THD7/D700. Just tell it you are using a TAPR TNC and then it will not try to tune the radio...

I had to reset the THD7,
how do I get it back to xmit a beacon on startup?
I've tried the instructions in the manual,
I can't get BCON to appear on the screen...
Thanks.

Rendered body type: text/plain

I've setup my laptop/KPC3 running APRS and my icon is showing on the
map. However, I get the usual msg "APRS did not see a digipeat of your
last packet" -- I'm running as a new user. I've lost the previous
thread as to how to fix this.

Also, have my TH-D7 running stand alone and the laptop shows it in the
heard list but no ICON or call shows on the map. The TH-D7 also does

not show the laptop call in the heard list. I went out to the aprs.net
and unless it takes a day or so to popup, I didn't see either one on
that map.

So what am I doing wrong.

Question regarding the radio. . .
While on battery power it started beeping and continuously reopening the
TNC as long as the BCN was on. (yes, I've had it upgraded)
Plugged in the transformer and it did the same til I put it on EL
power. I'm under the impression (from the packet operation setup) that
if the transformer is plugged in you can't tx on anything but EL. --
correct?

Question regarding program. . .
what function does the box at the top right hand of the screen have

I'm running an older dos version (865) under win3.1 on a 486 laptop. .
.should I download a newer version like winaprs with the 32bit drivers?
If so, which files from the ftp site do I need? What is winaprs lite?
and would that be better.

Sorry for all the bandwidth but decided to learn how to use this stuff
instead of letting it just sit around. . .I'm also going to Moab UT in
mid April and my stuff is portable and have access to a GPS unit. Would
like to be able to tx my location while out 4 wheeling.

THANKS! for any assist/tutoring anybody can spare time to offer.

Nothing to fix, other than getting your antenna up higher or moving colser
to a digi.. Or setting the correct path for that digi, etc...

What is the position on the POSITIONS page?

> The TH-D7 also does not show the laptop call in the heard list.

Is the THD7 ON?
Is it in APRS mode?
is it on the samre frequency as the laptop?
What do the packets look like?

These might seem like stoopid questions, but you have given no hints as to
what all you have invistigated nor details we can use to help...

140. [htaprs] APRStk Satellite Frequency Tracking

From: "Fred Hatfield" <hatfield@bellsouth.net>
Date: Sat, 18 Mar 2000 15:27:6
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-71933-2000.03.18-15.26.30--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

After a lot of fooling around and experimenting I seem to
have APRStk working with my D700. However, I have tried the
suggestion of having APRS 144.390 at the top of the satellite
list so that I still copy traffic in between satellite passes.

The problem is that after a satellite pass, HBAUD remains at
9600 and the 144.390 traffic (1200) does not copy. I can go
to O,C,T and tell the TNC to change HBAUD to 1200 by hand and
things work great until the next satellite pass is finished and
HBAUD remains at 9600 again.

Occasionally, the frequency will sort of 'flip-flop' between
the satellite and 144.390 during a long pass. Of course, the
HBAUD remains at 9600 during that time so the local traffic
doesn't copy -- but shouldn't the satellite frequency remain
constant until the pass is finished?

Hummh. Works every time for me, but then I am using the D7, not the D700.
I hope to get a D700 hooked up to APRStk, and maybe then I will see waht
you are seeing. It sends out the 144.39 command. Maybe it is not taking
because of a timng difference with the D700?

Yep, it should not flipflop. But sounds like it is trying to swtich some
of the time. Hummh...

Thing that bothers me. . .the laptop radio is running 5w battery plugged into the charge and receiving the packets identically to the Kenwood. It is on a J-Pole on the roof of the house about 10' feet above chimney. The Kenwood is plugged into the transformer (and I have now switched to H power--that beep and opening TNC prob must have been low bat related) and is on the rubber ducky antenna and sitting in the window.

The same as the laptop -- yes, I have read your expl about the call signs from the Dayton Convention so I zoomed out and still didn't see two icons. I will try offsetting the TH-D7 as an experiment (by the way it is set N 33:57:00 W 117:25:00 and laptop is at 33:54:83N and 117:14:52W).

Are you running your radio off the supplied charger? If so, it does not put
out enough power to transmit on high power. As the radio goes into
transmit, it loads down the transformer/charger and the radio will probably
beep do to a low voltage condition. This might explain why it works on low
power since it probably does not overload your transformer/charger.

You need a power supply capable of putting out at least 2 amps continuous to
be able to use it for transmitting on an HT. Try running your radio on a
fully charged battery not connected to your "power supply" and see if that
corrects your problem.

I only have the small wall charger that came with the unit and my question
is how do I know when the battery is charged? I don't want to overcharge it
and so try discharge it to near dead so I can put it on for a few hours
without too much worry. If it isn't near total discharge though how do I
gestimate how long to leave it on charge? If the only way is to get a
better charger I would greatly appreciate advice as to which model would be
best.
Thanks for any help.

When I plugged the unit into the charger/transformer it quit beeping and
re-opening the TNC on BCN. I then went to the manual to see how to check
battery status and it said to look at the bar graph during tx. If it's plugged
into the charger it shows a solid bar/S9. I've got to figure this one out
myself.

Hey! I see me -- both places. Don't know if any one else does but I'm seeing both my icons on the laptop -- base and mobile. They are both appearing in the "data" list now (duh, why would I expect to see my laptop show up on it's own heard list????). . .anyway; in looking at what was appearing I figured out that I must have some input errors on the TH-D7 unit. Yup, a few typos and a change from NMEA and wa la. . . .so, if any one else sees me(s) and sees errors in the packet info being sent, please let me know what I need to correct. Actually, this learning curve has been very good for me as I've been able to spend two days now all by myself, just me and my radio, getting to know each other and I think we've bonded :)
I might actually be able to operate the radio now (well at least this part).

BTW, does any one know of a URL where I can put in street addresses and get long/lat info?

Thanks again everybody for your patience and information. See you on the map!

148. [htaprs] D7/APRSDOS/D700 - strangeness

From: "Brian B. Riley" <brianbr@wulfden.org>
Date: Sun, 19 Mar 2000 21:02:03 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: "Bob Bruninga, WB4APR" <bruninga@nadn.navy.mil>
Message-ID: <LYR845-72215-2000.03.19-20.01.45--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been mucking about with APRS 846 and APRSTK here on an old 386 laptop. I am getting ready to leave the laptop which hardly draws any juice hung onto my KPC-3+ which runs the wide digi for NW VT and feed UO14/AO27 positions to the local area.

 After spending an afternoon making D7/D700 cables to replace the rats nest of tweenies et al. I left the laptop up on the dining room table running APRS846 as KA2BQE-7 with the D7 on ExtraLow power in TNC mode (as opposed to APRS mode). All seemed fine and I brought up the D700 and the GPS in the car

and set APRSDOS to track it and then left to go over to the next town.

OK, so far, so good. What I noticed was that although KA2BQE-3 showed up
nice and regular on the D700 list. KA@BQE-7 did not. I initiated a message
to KA2BQE-7 and it got ACKed, I forgot abput it for the moment, set the D700
to beacon every 20 minutes while I was stopped and when I came back out 90
minutes later, still no KA2BQE-7 in the D700 List. I resent the message from
before, changing the text a little and it too got ACKed. I started driving
home and still no "-7". I got home and went in, the system was running fine,
I watched "-7" beacon and be digipeated through KA2BQE-3, there was no way
the D700 could have missed that ... but still no KA2BQE-7 on the D700 list.
I went and shut down APRS846 and took the D7 and shut it down and then
brought it back up in APRS mode and forced a beacon ... wham bam thankyou
m'am ... KA2BQE-7 right on the top of the list ...

  ... WHY???????????

150. [htaprs] Cool D700 Tricks

From: "Brent Hildebrand" <bhildebrand@earthlink.net>
Date: Sun, 19 Mar 2000 20:25:43 -0800
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-72235-2000.03.19-22.23.56--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Try this:
When you send the D700 "AI 1" via the serial port, is will echo back
commands as you execute them on the radio's controls. Turn the radio off,
you get "PS 0". Try sending commands to the radio when it is off. It
echoes "?". But it is off! Send it "PS 1", the opposite of "PS 0".
Nothing. Send it "PS 1", wait a split second, and send it again. The radio
turns on! So you can turn the radio on and off from the serial port.   Now,
turn the radio off, and disconnect to control head. Send the "PS 1" on
sequence. The radio turns on.!! You can completely control the radio from
the serial port with the Control Head disconnected. Oh the possibilities!!

I wondered about this. With this info, at least the radio would have still
some use if the control head became unusable/damaged/lost/stolen...

I am very pleased with the MH-C777. I usually leave is set up for my
D7 battery, but also use on several other packs.
Its at http://www.maha-comm.com/products/chargers/mhc777.htm

It handles several voltages, has a discharge cycle, also a jack for 'jumper
cables'

Here's is the top link for your book mark: http://www.maha-comm.com/

Morris Hays wrote:

Rendered body type: text/plain

Hi,

I am considering purchasing a D700. As I have two vehicles, I would like to be able to move the D700 between vehicles. Are spare control heads available? How are the control heads mounted? Is it cumbersome to move the control head and radio in and out of the vehicle? How long is the control head cable? What is the current best going price for a D700?

Thank You,
Paul Jacques

Rendered body type: text/plain

Kenwood will not sell replacement control heads. Their documentation states
that they are not available. I have a D700 that I move from my vehicle to
my shack, and vice-verse. As of one month ago, the mounting bracket was not
yet available either, so I made one out of sheet metal. The Kenwood service
center had no replacement parts for the unit at that time. They may have
parts by now. I suspect that they are expensive. The bracket comes in two
parts, a self adhesive base and a tilting bracket.

The head is easy to remove. It slides into the tilting bracket. To remove

it, press a detent on the bracket and slide the head off. The cable from
the head to the radio is long; perhaps two meters. You can't readily
shorten it. I wish I had a second cable because the most time consuming
task to move the radio is to reroute the cable.

You will not be able to get a spare control head until
Kenwood changes its statement that they will not be
available..

You need to either "build" your own extision cables, or buy
the extension kits from Kenwood or a third party...

I made a second bracket for the control head, run two sets
of cables in two seperate cars.. Unplug from one, plug into
the second car and go..

Too bad Kenwood's software doesn't have a virtual frontpanel like the TS-570
does.

No, they do not sell spares
It is a phone modular connector.
Its a snap to detach it and move it an re-plug in at the other car...

When I put my d7 in Packet mode and plug it into my laptop, it seems to be
deaf as a post! It will only show the position of a station that is very
close. The radio seems to hear ok but nothing shows up on the computer..
Have I missed something in the set-up? I'm using WinAPRS in the laptop.

You may be getting noise from the PC into your radio through the data
cable. I encountered the same problem with a home made data cable.
I installed a snap on line filter from Radio Shack. It worked fine
after that.

Supposedly, some from Kenwood mentioned the signal has to be
full scale to be decoded. This can be very close to accurate
as far as I am concerned.. Also, the stock antennae seems to
be lacking somewhat.. :-)
Try a better antenna and height.. Welcome to the club...

As I was just e-mailing Marc, VA3DRV to sign up for the APRS meeting in
Ottowa next month, it occurred to me that with hamfest season upon us, and
particularly Dayton, that thought needs to be given to the social protocol
of when to leave your digipeater on in your D700.

Almost everyone I know of who has a D700, except Hasan, also has a D7; and
most of them leave digipeat on so they can use their D7 on EL power from
whereever.

 It seems to me that a parking lot with even three or four D700s all with
digi on would be a mess; lots of frames bouncing around and not getting very
far. A dozen or so would be a disaster!

 Just my $.02!!!

I have two modes of operation for my D700,

 Memory mode 1: Driving with GPS on, beacon every 2 min. Digi off.
    No need to use the D7 while driving the truck

 Memory mode 5: Parked with GPS on, beacon every 30 min. Digi on. (relay)
    EL power is used on the D7 when I am not driving and I am outside of
the truck.

  Brian, you are right a parking lot full of digi's would be a mess!

  Dwight

Instead of Relay as alias, use your callsign with another ssid on the D700
in digi mode. Then, you will be the only one with that call in ur upath from
the D7...

In essence that is exactly what I do, except what you call PM5 I have in
PM3 and in PM2 I have the same thing as PM3 except with DIGI OFF.

One thing I do differently is that I have the digi do RELAY,WIDE,TRACE, that
way I can 'see' what is going on as my D700 will repeat stuff coming from
the KA2BQE-3 digi. My location at work is tucked in a low spot where I can
hear and be heard by my Wide digi a home but will not likely be heard beyond
a mile or two

 I know all the nuts and bolts here, but the point I wished to make was that
with the newness and popularity of the D700 and with Spring coming and that
meaning ham and particularly APRS gatherings in the near future we need to
anticipate what could happen and get D700 owners thinking along those lines.
I would be very surprised if any of the D700 owners out there had even given
it a thought. I certainly would not have if I hadn't been corresponding with
Marc about the upcoming APRS meeting and he and I both being D7/D700
owners/users who regularly keep the digi on when we are parked so we can use
or D7s while apart from our vehicles.

Rendered body type: text/plain

In using my TH-D7a to check APRS WX broadcasts, I can receive all Davis,
Radio Shack and Peet UII WX stations but not my own Peet U2K or any of the
other Peet U2000 broadcasts. I and the other U2K stations (in town) are
sending WX out in Peet Data Logging Mode (prefaced with "!!"). It doesn't
matter if I set the unproto to APRS or to the default APK001. I can see and
read the WX data fine using APRS Plus or WinAPRS, just not on the TH-D7a.
In receiving the original APRS traffic I only see "?? W0HII" or "?? AJ0A"
(both Peet U2K Stations). Anyone have a easy fix or idea what my problem
is?

TIA

John W0HII

> digi on would be a mess; lots of frames bouncing around and not getting very
> far. A dozen or so would be a disaster!

Then bring them in doors! I need seven D700's, one in each room at Dayton serving as BOX-N digis. I am building 7 Special BOX-N digi antennas which when stuck on a D700, will attenuate their reception by 60 dB so that they will only pick up D7's that are in the same room with them. SInce the D700 does Callsign Substitution and APRSdos does vicinity tracking, then everyone indoors with a D7 will be captured and placed in the correct room on the APRS maps. THus INDOOR APRS tracking!

Ill make the attenuators/antennas if others of you will bring your D700's indoors. The arena (kenwood) and North hall (APRS) are already covered. ANyone else with a D700 going to be stuck in one of the other rooms?

To see how indoor tracking works, read VICINITY.TXT included in all the README files with APRSdos...

In fact, a few of these outside in the corners of the flea market and then we can track everyone without anyone having to carry a GPS. THat is, at least we will know where they are within about 100 yards (which is no worse than GPS with SA anyway...!)

Dont worry about QRM. THese BOX-N digis will listen on 144.39 but transmit what they hear on a UHF freq...

Here's a challenge. Check out the D700 ad on the back of QST. How many "errors" are there on the D700 control head display? So as not to split hairs, let's assume standard "defaults", etc.

 Well here is what I see;

 1 - APRS on 146.97 (-600) - except it could be a MIC-e enabled repeater -
which is further evidenced by the PTT being on the APRS side.

 2 - 448.525 MHz (+5 MHz) is out of the ham bands

> close. The radio seems to hear ok but nothing shows up on the computer..
> Have I missed something in the set-up? I'm using WinAPRS in the laptop.

Me too. If I plug the THD7 into my Psion palmtop the psion de-senses the THD
to the point it isnt useful. I wanted to be able to remotely reprogram the
digpeater in the car :(

Last weekend I went to a radio rally with the THD7, its front end is
about as wide as you can imagine, all sorts of hams were coming through
on several frequencies at the same time (ok, probably mixing products, there
were a lot about) but I did have the official kenwood attenutator (whip
antenna) in place, and its never happened with any other radio..

I bet it underperforms on a base antenna?

Its ok as a handi tho.

I am having the same problem and am wondering if it mght be solved by using the Kenwood RS-232 cable instead of the home brew one I am using. Since pictures of the Kenwood cable appear to have filters at both ends and I don't on my home made cable, could the cable be acting as a broadly tuned antenna and de-sensing the D-7 ?

If vicinity tracking will work with the D700's, This could be the answer to the caving question. Underground digi's !! Just what the modern caver needs.

Rendered body type: text/plain

Here's the deal. We are testing some mobile IP routers (www.nova-eng.com
and click on the NovaRoam 900.) These are 900 mhz spread spectrum mobile
ethernet devices with a max speed of 1.008 megabits.

I got to wondering how to make coverage maps. Right now I stop the jeep,
ping the office, and see if it works.

If I hook up a GPS to the laptop as for regular ol' APRS, can I
configure one of the APRS programs like APRSdos or WinAPRS to send posits
out the network, instead of a TNC/radio? At the other end, can I have one
of the programs pick up the posits off the network like one of the
servers?

If I could do that once a second, all I have to do is drive around town
for a while and then come back and look at the map to see how coverage is.

Any thoughts?

Chris

I almost purchased a D7 this afternoon, but apparently Kenwood's offer to provide a free cable and software has expired. I can find no reference to it on their web site, and the sales person thought that the offer expired of 2/29. Does anyone know if the offer has been extended. If I have to buy software and cable, plus other goodies, that increases the price. If the price with accessories goes up much more, I might buy a different radio.

Also, the sales person hinted that the radio is somewhat awkward to operate. My eyesight isn't what it used to be, and I'd be frustrated if the controls are poorly thought out. Any comments pro or con?

I have this same problem with the factory Kenwood RS-232 cable. I have to remove the rubber duck and connect to a gain antenna for things to work properly while connected.

Yes, instead of a TNC, your data will go through your network. Its plug
and play...

I have run the D7 with my home made Mouser cable sans snap on cores, on two
different model Mac Powerbooks, a Toshiba 1850 Satellite laptop, and IBM
PS-2 laptop, Gateway 2000 P60 system and my mainstay PowerMac G3 ... the D7
ran just fine with the stock rubber duck on all of them.

I will say that when running my PowerMac I had to be careful where and how I
oriented the D7 there were one or two spots that would get some hash but
that was cured by simply moving the talkie a few inches.

At work I run the the stock rubber duck, EL power about 300 feet to my
Blazer with the D700 as a digipeater through about 5 masonry walls and my
classroom is next to a room full of computers.

I also cave a Comet SMA-24 antenna and there is no question that it works
better than the duck, but there is no question that its not an antenna that
you keep on an HT all the time - it would be destroyed in a a few days at
most.

There is a price to be paid for every benefit!

i have replied to several posts about status on the two aprs digis in las vegas.

i sent e mail to n7zev frank who runs the digis, and hope to hear from him.

i think the snow up on digi 1 at 8200 feet on mountain potosi may be a problem, the other site digi 2 on apex north east by the air force base, no ideas other than hardware malfunction, i live on the east side and been unable to hit the digi.

i also am not sure of the I- gate operator.....soon as i get status i will pass it along.

we sure miss the digi repeaters in las vegas thats a fact!

Hello Dick (and the list),

I've built my own serial cables, and found that when using twisted pair, one side of each pair needs to be grounded, or else there are spurious signals all over the place (and crosstalk galore).

Just my 2 cents,
Joseph KB7PPL

My FT-8500 has this ability, and I got in in 1996...CAT control thru the
packet port. What's cool on the FT-8500 is you can set the radio, lock the
controls, and remove the serial microphone. Then no one can change your
APRS settings! About the only thing they can do with the radio is turn it
off and on.

197. [htaprs] APRStk problem

From: "Fred Hatfield" <hatfield@bellsouth.net>
Date: Wed, 22 Mar 2000 5:35:57
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-72840-2000.03.22-05.35.31--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Still working with APRStk and a D700. The big problem
seems to be that right after the first pass of a tracked
sat, the B side TNC remains set at 9600 baud even though the
switch to 144.39 takes place. This effectively kills
any copying of 1200 baud signals.

It also means that any 144.39 transmissions after that first sat pass
from my home station go out at 9600 baud instead of 1200 and
consequently not copied or seen by any 1200 baud stations.

Is anyone else having this problem?

Fred Hatfield K8VDU
New Orleans

Richard -

This has been such a weird story, right from the beginning! Kenwood has
always touted how they offer the programming software for their rigs for
free on their FTP site. Along comes the D7 and they suddenly decide to
pull the software after a short while and make it available only for
sale -- the hook is an "in-depth" manual in electronic form on the
CD-ROM that now has the software.

Then, in an apparent change of heart, they offer it free with new D7
purchases! Now you're reporting that the freebie is no longer? Sheeeesh!

Well, here's my two cents -- the beta software was snatched by a lot of
D7 owners while it was on the Kenwood site, and you're likely to get
offers to send it to you if you want it. There are a couple of noted
bugs with loading DTMF memories and air band memory presets in the beta,
and I don't know if they were corrected in the version on the CD-ROM.

The cable is a straight no-brainer to construct, and will cost about $10
in parts depending on what you can cannibalize (the 2.5mm stereo phone
plug is a little exotic). Check my website for the wiring instructions
and a couple of plug source suggestions, at
http://www.eabehl.com/hamradio/files/thd7plug.txt.

I also just saw a link to a guy who has written a replacement piece of
programming software for the D7, and it includes a simple packet
terminal emulator. The site is http://www.qsl.net/wa3hrl. I haven't
tried it yet myself, but it sounds promising.

Also, there are a couple of sites listing the complete set of control
codes for the D7 and D700 radios. Check Darryl Smith's site at
http://www.ozemail.com.au/~vk2tds/d7.htm. The storage of memory
locations is one of the commands. If you're into understanding how the
radio communicates with an attached PC, this might be interesting.

As for the keyboard layout, I can't complain (and I normally complain a
lot). All the typical things you would want to change during operation
are single, or at worst, double button presses on the keyboard. All the
more esoteric settings are available in a menu structure that has text
labels to guide you. The four-direction jog button makes navigating the
menus easy, though it sometimes is a little hard to press the top corner
instead of the left one.

But what makes the D7 shine is the built-in TNC, packet, and APRS
functions. Here, the D7 has no rival, and with all its other
shortcomings, the digital capabilities still place this rig in a class
by itself. If you can get by with any other H-T, maybe you *should*
pocket the price difference and choose an alternative. The D7 isn't for
everybody, and you'll likely find that it isn't the primary voice radio
for those that own them.

It isn't my "preferred" H-T, but it has capabilities like no other. The
D7 is, by itself, a self-contained APRS station. Add a GPS and it
becomes a portable tracker. Add a palm or laptop PC and you have a
battery-powered, two-piece, extremely compact packet station.

This is what makes the D7 a "must have" for some amateurs. The
programming package was a nice perk, and if it's now gone, it's a shame;
but -- and this is coming from a guy who beats on Kenwood at every
opportunity -- it's not what should make or break a D7 purchase decision
for you.

Good luck and 73!

Well, there is TCP/IP to worry about. The windowing built into the
protocol will eventually detect a failed connection.   At that point,
you'd have to reconnect to the server, which is not exactly immediate.
Furthermore, the windowing will buffer transmits for retransmission
during short coverage hiccups. As a result, you'll get posits from
spots where there is no coverage.

The "real" solution would be to write a quick piece of code to capture
every NMEA sentence off the serial port, and package it in a UDP/IP
datagram.

Rendered body type: text/plain

Thanks for the information concerning the cable. I found a open box D7 at
HRO in Salem NH that they discounted because it was missing the GPS cable.
I hesitated purchasing it because I had previously been unable to find a
cable. I would have never thought of looking in the telephone section for
it. I picked up the cable at Radio Shack, then the D7 at HRO, and saved
about $30.

If anyone else is looking for a D7, they have a second open box unit that is
missing the 12v power supply.

The same connector is used for the D700.

You have the Radio Shack part number listed wrong. It is 43-2003, not
42-2003.

Now that I have a TS570, TM-D700, and TH-D7, I thought I might try to run
SkyCommand. In theory, I could work HF remotely from my car, as long as I
was within range of my shack. Has anyone out there tried it yet? I had
heard that it is not legal on 2m, but I think it is OK on 440. Does anyone
know what the limitations are. Do I need permission to run a repeater? Do
I need some kind of phone hookup so that I can disable my radios remotely?

The working of the radio is ok without too much looking, but still needs lots
more eye power than using the DJ580e for example, but pretty well

all the tnc/aprs functions require fairly frequent scrutiny of the
LCD for really quite small indications of status.

Hello Joseph & the list from Oz,

                For my $A0.20 worth.....

When I made up 2 data cables, one is quite long around 3m (10ft), I used
twin shielded cable and added a small ferrite beads on each of the active
conductors.
These were fitted in the DB-9 plug shell and each conductor looped through
one turn. I have not had any problems with spurious signals etc.

One other point to be aware of, that is not mentioned in the TH-D7
handbook, programs like the APRS tracking program UI-View, need pins 4 to 6
(DTR=>DSR) and 7 to 8 (RTS=>CTS) linked in the DB9 plug.
The genuine Kenwood cable has them in place.

 I bought mine from HRO in Salem NH, for $679 -- they pay shipping and NH
has no sales tax, this may be a better bottom-line price that $639!

This is a little off center for this list but as it invloves a GPS
connected to a TH-D7a for APRS and most of you are way more electronic
savvy than I am, here goes: Can the GPS unit be connected to the TH-D7a for
APRS and also be connected in parallel to a small flight computer at the
same time that would use the same NEMA strings for final glide and speed to
fly computations? Do they have to handshake or can the TH-D7a just wait for
and then receive the data when it is sent to the flight computer (a high
end variometer)? If one of the devices just waits to receive the data then
maybe there would be no conflicts.?.?. This would be used for
sailplane/handglider cross country tracking. Sometimes I think I should

have listened to my mom way back when she told me to stay out of the deep
end of the pool till I knew how to swim :) . Thanks for all responses and
all the help I've had on this list in the past.

Cant say for sure, but I have my GPS connected to the THD7 and have the
GPS out line connected to another TNC RX line simultaneously without
handshaking.

How do you update the entire satellite list?

I have been using the I-K command to read current
kep lists that I downloaded from AMSAT but the only sats that go into
LEO.ORB are AO10, MIR, and ISS. All the rest seem
to be ignored.

And the hbaud rate still will not switch back from 9600
baud after a satellite pass, effectively stopping any
further operation of APRStk after the first satellite pass.

Hi Kell

I've connected the output of the GPS to my KPC TNC and my Computer on
numerous occasions and it works just fine.

>Do they have to handshake or can the TH-D7a just
> wait for and then receive the data when it is sent to the flight
computer

There are two issues here. First, the data is continuously sent from the
GPS at one second intervals and both units will receive the data
automatically when their inputs are wired together and connected to the
GPS output as mentioned above. No handshaking is required from the
receiving units (D7 and Flight computer in your case) to enable that
transmission.

Thus it's unlikely the flight computer would have a wire to transmit any
information back to the GPS unit.

The D7 can send waypoint data back to the GPS if it is equipped with the
capability to receive NEMA waypoint data and if it has a display. Thus
you may want to have the input to he GPS wired to the output of the THD7.
  It is not required.

What is important is that you NOT wire the outputs of both the D7 and the
Flight computer together and tie to the input of the GPS. In other
words, a wire can have ONE unit sending data although you can have
several units receiving that data.

This is really simple, I hope I have not made it complex...

Subject: [amsat-bb] THD7A question.

My name is Nathan Hagerman, I'm a senior at the United States Air Force Academy. I am trying to use a Kenwood THD7A for a satellite balloon prototype, and I'm having a problem getting it to run in kiss mode. Our SpaceQuest flight computer outputs KISS packets (we can see that through a comtap program and through using the computer before on other projects), but we cannot get the radio to transmit the packets. We have tried software commanding the radio into KISS mode from a PC (<kiss on> and then <restart> from a dumb terminal), disconnecting it from PC and connecting it to the flight computer and PTT'ing the radio while the computer sends packets, but we get no modulation on the signal. The radio is not shut off between changing computers, in hopes of staying in KISS mode, but still no success. Does anyone know what process will work to get the radio into a KISS mode that will function? Thanx in advance.

There are 4 options presented to you under the INPUT-KEPS menu:
 1 - Enter an initial list of object numbers
 2 - Update elements from a NASA formatted 2 line file
 3 - Update elements from a AMSAT formatted file
 4 - Load a new AMSAT formatted file.

Options 2 and 3 will update your current LEO.ORB file
Or Option 4 will allow you to load in a new list. (but it wont have the
pseudo APRS 144.39 satellite as the first entry which is useful if you
also want to monitor 144.39). (Or just download the latest APRStk. I
always give it new keps before posting. Current version is 09).

I always just use option 2. If I want the "update" to pick up some new
satellites or if I want to delete some satelites, then I use a TEXT editor
to DELETE a satellite or to Add a satellite. TO add, just duplicate
an existing one, and all you need to manually edit is the OBJECT NUMBER
and the NAME. THen when you INPUT-KEPS-2 to update it, it will get all
the new keps for that new satellite.

Then if you want APRStk to auto-track/tune, then you may want to edit the
SYSTEM\SATFREQS.SYS file. to add your new satellite there..

> And the hbaud rate still will not switch back from 9600

You must be using a D700. THis problem has been reported and I will try
to get to it next week after this saturday's APRS events and SUndays
Balloon launch..

Thanks. Hope this helps..

** High Priority **

Kell,

I am a hang glider pilot and I tried what you are asking about. I hooked a Garmin GPS III output to a TH-D7A and a Ball Comp Vario. The output from the TH-D7A was also hooked to the GPSIII input. Everything work fine except that RF kept getting into the vario and the audio and readouts for the vario would go nuts for a few seconds when the radio transmitted. I called Ball and they said that a filter could be built to prevent the RF from disturbing the vario. However, as of this time, I have not sent the units

into Ball to have them work out the filter system. It will work though.

 This is a little off center for this list but as it invloves a GPS
connected to a TH-D7a for APRS and most of you are way more electronic
savvy than I am, here goes: Can the GPS unit be connected to the TH-D7a for
APRS and also be connected in parallel to a small flight computer at the
same time that would use the same NEMA strings for final glide and speed to
fly computations? Do they have to handshake or can the TH-D7a just wait for
and then receive the data when it is sent to the flight computer (a high
end variometer)? If one of the devices just waits to receive the data then
maybe there would be no conflicts.?.?. This would be used for
sailplane/handglider cross country tracking. Sometimes I think I should
have listened to my mom way back when she told me to stay out of the deep
end of the pool till I knew how to swim :) . Thanks for all responses and
all the help I've had on this list in the past.

I ordered my D7 from AES for $399 yesterday. It appears the free D7 cable &
software offer is valid until 3/31/00, according to the AES and a few other
online vendor web sites. I also checked the Kenwood site and it confirmed
this date.

Now, I just have to pass my Tech-nocode exam this Tuesday ;-)

 No problem, just wire up the GPS cable as a "Y" he only thing is you don't
want to have the data out of the D7 and the flight computer "Y"-ed. You
would select either the D7 or the flight computer to send data (usually
waypoints) to the GPS if it accepts them.

Ma'am/Sir,

I am Systems Engineer at the Air Force Academy and responsible to help
cadets build small satellites. We are going to launch one on a high altitude
balloon on April 8th.

We use mobile radios to command the spacecraft. One radio will be connected
to a notebook. This set up will be our mobile ground station. The other
radio is connected to a computerboard on the spacecraft.

The radios we bought are TH-D7A. We need to use them in packet operation and
KISS. We tried to set it up for Kiss and 9600 baud but could not get any
data to be sent out by the radio.

We do not know what to do and were wondering if anybody could help. Mr.
Clifford from KENWOOD has given me your e-mail address.

If know how to set up those radios for KISS mode and 9600 baud please
contact me. I am very grateful for any advice I could get.

Thank you for your support!

Gabriele Belle

Gabriele,

Not meaning to speak for the entire mailing list, but I'm sure there are lots of us that are willing to help.

There has been some recent mumblings on the list about possible problems with the KISS implementation. This has not been definitely confirmed by anyone. KISS is sort of tough to diagnose, since it really requires you to write software to test it out.

Also, Kenwood has been less than forthcoming with information about the KISS implementation, placing that documentation on a CD that they charge extra for. I have not purchased this CD, but others on the list have. Perhaps one of them would be willing to excerpt the meaningful passages of the documentation for you, as this would qualify as educational fair-use.

Furthermore, you can speed the diagnosis by providing extra information about the configuration, the symptoms and the steps you took to set up the system. For instance: does the red transmit led illuminate at all? Continue to copy the list (htaprs@lists.tapr.org) on every email about this topic.

There will be a 10 mW 433.910 MHz balloon launched from the Timonimum
Hamfest (N. Baltimore, MD) at 1230 SUnday afternoon 25 Mar. It has only
one tone to indicate Temperature. But we will use all the power of APRS
for DFing the balloon, so come join us with your mobile handheld UHF beam
for an afternoon of DF fun.

I will post a list of UHF repeater freqs Friday to be used for
coordination. Bring a compass. (No data is better than bad data.)

THe balloon is on the air now on the roof In Annapolis for local DF
practice (you can only hear it out about 2 miles due to terrain.)

We will be beyond WEB page access and so will need someone to kibitz from
their home to tell us the upper level winds at launch time on the local
UHF repeater.. Here is the site for Dulles Airport.

http://www.comet.ucar.edu/dstreme/data/stuv_IAD.txt

de WB4APR, Bob

Also on Saturday we will be using APRS and APRN (SSTV handheld cameras)
to track/document the Naval Academey 18 hours of greuling field trials for
hundreds of midhhsipmen. THis will be on 145.55 MHz if you are local.

i was up in the mountains again today and fired up aprs and both of the las
vegas aprs digipeters are running, the i gate is also operational   run
by n6bg

hey i had my position listed as inside area 51 the place that does not
exist and got a interesting phone call a few weeks back.

someone though i really was inside the area 51 complex.

it was a great conversation.

the area 51 coordinates are (but this place does not really exist)

37 10 00

115 47 00

Sorry Nathan,

    The USA model of the THD7A does not transmit KISS mode. The
European model TH-D7E version 2 does do Kiss mode properly, nut this is
too late for you I am afraid.

It works beautifully in normal cmd:/converse/UI packet mode...
That is how we use it for APRS...

CAVEAT: I am *NOT* pushing APRS on FRS frequencies. I only mentioned
FRS on this sig as an alternate means of radio VOICE communications in
our emergency work... So the following is only provided in answering the
mail here with regard to my understanding of the rules... NOT as a
recommendation...

> Why not start a APRS network running FRS radio's???

ANS: Because Its illegal for "digital communications" on those channels.

> From what I understand from the rules, we could do this as any tone(s)
> passed on the FRS frequencies above 300hz, can not last longer than 15

> seconds.

ANS: The "digital" rule means APRS PC-to-PC is Illegal. BUT APRS in
Mic-E mode where it is only an identifying tone-burst on the end of a
VOICE transmissions is perfectly legal. I confirmed this with the FCC.
In this case it is like SEL-CAL and the FCC acknowledges that there are no
hard "rules" for what constitutes a legal "SEL-CAL".

So, APRS Mic-E's (A Mic-Lite constructed inside a speaker-mike) can be
used on FRS for the purpose of tracking the movements of a VOICE user.

The only argument that remains is the language that "you may not attach
any ANTENNA, POWER AMPLIFIER, or "other" apparatus that has not been TYPE
approved for use with FRS..."

And the argument then rages on about whether or not SPEAKER-MIKES are
considered "other" apparatus as intended in the above rules.... I dont
think I have ever seen a "type-acceptance FCC sticker" on any speaker mike
for ANY service...

Duck and run for cover....<grin>

Oh, for a picture of some speaker mikes with Mic-Lites built in, see

        http://www.toad.net/~wclement/mim/mic-lite.htm
     or http://www.toad.net/~wclement/mim2.htm

We use them here with non-kenwood HAM RADIO HT's as a plug-n-play way to
track VIP's at special events...

229. [htaprs] Re: [aprssig] Baltimore MD Balloon Sunday REV2

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 24 Mar 2000 12:00:14 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-73345-2000.03.24-11.00.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is the final? revised? data on the Party-Balloon launch:

There will be a 10 mW FM 433.910 MHz balloon launched from the Timonimum
Hamfest (N. Baltimore, MD) at 1230 Sunday afternoon 26 Mar. It has only
one tone to indicate Temperature. (1800Hz = 130F, 240Hz = 0F)

Photo: http://web.usna.navy.mil/~bruninga/balloons.html

We will use all the power of APRS on 144.39 for DFing the balloon, so come
join us with your mobile handheld UHF beam and COMPASS. Late info will be
announced on the HAMFEST talk-in freq of 146.67. APRS ops will talk on
the linked 449.625 PL=107.2 so we don't desense our APRS DF data. There
are NO nearby DIGI's so we need someone to put up a temp 144.39 digi for
us..

Also we will be beyond WEB page access and so will need someone to kibitz
from their home that morning to tell us the upper level winds via 146.67
from the Dulles Airport data at:

        http://www.comet.ucar.edu/dstreme/data/stuv_IAD.txt

Depending on winds we may go for a <16 mile mission to land short of the
Bay, or a long mission >26 mi to land on the E.Shore. The shorter mission
will be preferred... Landing in the Bay is a loser..

de WB4APR, Bob
>
> Also on Saturday we will be using APRS and APRN (SSTV handheld cameras)

Rendered body type: text/plain

I'd like to be able to disconnect my D700, and connect my D7 to the same power cable. The reason for doing this is that I have several vehicles, and I don't know which radio I will want to plug in. When I run the D7, I may want to also plug in a small linear amp. I like the T cable that Kenwood supplies with their D700, but can find no convenient source for the mate to it (the same sex that is attached to the radio). I don't want to endup with a large minimum order from a commercial distributor. Does anyone know a source for these connectors?

To the gang -

Yep --- I was dumbstruck by Bob's response for a while, too. But I scoured the user's manual, and it's clear that the TNC is AX.25 compliant, but also says some functions available with other TNC's are not available on the D7's TNC. In the list of TNC commands, KISS is not mentioned. That explains why JNOS won't work with the D7.

What's weird on my unit is that the radio actually keys the transmitter, sends the initial tone, but no data, then drops. You can extend the length of that tone with the TX Delay parameter, but still no data.

It's a shame the E versions get the KISS functions but A units do not. I wonder if that was just a matter of the E's getting a later release of software?

 Is there any possibility that this will be fixed in a future firmware
upgrade?

You should probably direct this question to Kenwood at:

Kenwood Customer Care [cuyeda@ix.netcom.com]

They probably get a copy of all our messages, but they may not respond
unless a question is directed to them. They have been pretty good about
answering my questions.

Specs for the D7 don't seem to list KISS as a supported protocol. This
implies that they are under no obligation to support it. They may have run
out of code space in ROM and had to cut it out, or it may be an error. I
sure hope they can fix the problem. Please let us know what they say.

I was not aware that there were any firmware differences between TH-D7A and
TH-D7E. I was under the impression that the hardware configuration alone is
different, and the D7 firmware detects which model it is by the diode
configuration.

If so, this should be a current firmware release, and could be provided to
address this particular emergency by Kenwood today. In my opinion, Kenwood
should promptly fix the D7A's in question to facilitate this particular
student project.   It stops being a "business decision" when it starts to
impact the quality of an education; it suddenly becomes an ethical, not
fiduciary, issue.

 It (KISS) is in there and the commands for are is in there, it just doesn't
work! It didn't work in the European (TH-D7E) firmware and it seems it was
fixed in the subsequent upgrade. It apparently didn't make it to the earlier
released us firmware upgrade to the TH-D7A. So my question remains, to Bob,
whether he has heard anything about a future firmware upgrade for the TH-D7A
and if it may include a fix to KISS among other things.

I just got back from the IWCE show in Las Vegas. Wed night I was not
able to get any digi back from my D7 from the 24th floor of Ballys. I
tried by windows on all sides. Then Thurs morning I tried outside in the
parking lot in the back. I could hear an occasional packet from
N7ZEV-2, but apparently could not get in. Is the receiver really deaf
or what? I tried Relay, Wide,Wide - Wide,Wide - and v N7ZEV-2

The D7 is working fine. I turned it on when I got home and heard all
kinds of digipeats.

I dont know any more than anyone else. But KISS was not part of their
specifications, although it is obvious they tried to fit it in..
Remember, The THD7 was released in the USA in December of 98, and early
models had 3 minor bugs. ALL units were recalled and repaired and the
remaining prodction was bug free. It did what it was advertised to do...
APRS, GPS and normal packet.

I think About SIX months later when they began producing a European
version, they soon found out that the Europeans do not use
APRS, and they all wanted KISS. At this point, I think ALL
EUROPEAN models were recalled and re-designed. I imagine at great
expense...

My worry is that being twice burned by trying to satisfy everyone with
everything possible stuffed into the palm of your hand, they might decide
the risk is just too high to follow up with another model that is so
complex. I am forever amazed at all the things they got RIGHT!

Try J & L. Their web-site is www.randl.com. I don't know if they will have
the connectors, but their power cables are so cheap compared to the oem you
may want to buy what you need premade.

The cable assembly is $7.95 and the part number is IC2000 They also make
one for HF Rigs, and the price for the KW2000 is $14.95. Much much cheaper
than the Kenwood or Icom power cable for HF rigs.

Their phone number 800-221-7735.

This is at least an alternative. Another alternative if you are going to
make your own is to use a standard molex.

Scott

The answer is
Anderson Powerpoles

A quick read of the aprssig archives will give LOTS of
information.

As Radio Shack has the same T power connector on their HT-10
you might get one there or on radioshack.com.

Both powerpoles and the OEM T connectors can be found at
www.powerwerx.com

 amen to that; I am amazed at all my D7 does and extremely happy with it.

But the commands do seem to be there, just nothing happens ... why 'another
model?' Why not a firmware upgrade. I have no idea how 'full' the firmware
memory space is, but an upgrade ROM with KISS in it would something that I
would want. I think they should give it to us, but I would pay for it if
there was no other way and I would bet I am not the only one who feels that
way.

Rendered body type: text/plain

WOW, APRS/ce is a great piece of work! My hat is off! DOS maps work very
well, haven't tried any others as yet.

However, I have one small problem that I have not had time to solve.
I receive OK (stations show in the station list and print on the map), but
for some reason can't TX. I am using the same cable I made up for pocketAPRS
with the Palm III, which plugged into the 3COM serial cable, but the
Cassiopiea E-105 serial cable doesn't seem to like it :-(

Anyone else using a Casio Palm unit and had a similar problem?
Any hints on re-wiring the cable? Do I need to tie a couple pins together or
something else?

Bob,
  I'm using the Casio e-100 with a PicoPacket when
mobile and MFJ 1278 when fixed.

I have a db9 male to db9 male null modem adapter
attached between the Casio cradle serial port and TNC.

APRS/Ce works with both TNC's without problem.

245. [htaprs] PubSafety Mobile Data Terminals

From: "Wayne H. Sanderson" <whsander@erols.com>
Date: 26 Mar 2000 00:58:44 GMT
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-73575-2000.03.25-18.57.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just scored some MDT-870 radio data terminals on eBay. These are ruggedized squad car/public safety vehicle mounted data terminals with a serial port on the back. They have built in amber text only displays, full keyboard and a dozen or so programmable function buttons. They can be set up with individual unit numbers for private messaging or all call, etc. The specs say they are manufactured to be GPS/AVL integration capable.
These are industrial/public safety grade packet terminals. Just search for MDT-870 on Altavista for some comprehensive info sites on them.
If you run trackers in events or field mobile units for disaster service, wiring one of these in gets you full messaging capability out of dumb tracker units without having to risk a full mobile station plus your valuable laptop, and you can program the function buttons for various canned messages and acknowledgements, emergency, etc., so non ham non computer savvy operators can use the things and acknowledge messages without typing by reading a little card telling them which function button does what. And the keyboard is coffee spillproof too ;-) Hook them up to a TNC and off you go.

I have to wonder whether this would not be a super substitute for the D-700 control head. With over a dozen function buttons, the On, Off, APRS packet on, etc. commands could all be programmed into buttons or even all into one button, and that if the startup is not scriptable, which it might be.

The vendor has more that are not listed yet on eBay, and they are for sale. If anyone is interested e-mail me and I will send along the vendor's address.

Rendered body type: text/plain

Has any one tried Precision Street Maps USA with WinAPRS. The docs say that you can use Street Maps v.3.0.1 and higher. I don't have a version number on my CD, just the name. The map format is 06.zp3, for example. I assume that would be the California map, again based on the docs. I'm interested in a good map of the Los Angeles area, and the Precision product is very detailed.

Thanks for any help

I really hate to rain on a parade, but I doubt you can just wire one to a TNC and use it. First MDT's use a proprietary FSK transmission scheme (no external modem/tnc is needed) and the MDT 870 is just a dumb terminal. I don't think it even has a RS-232 output. There are several private concerns/businesses that use MDT's, but it is mostly famous for it's deployment in Public Safety use (mostly police).

In light of recent actions by certain law enforcement agencies (Remember Bill Cheek?), I would be very leary about even posessing an MDT, ESPECIALLY in mobile situations as a private citizen citizen. Although I feel that you and I have the right to own and use this equipment, your local police/prosecutor might not agree. And I would not want to be the test case for SoDak... If you would like to go on a legal adventure/misadventure this might be the route to go, though.

My local PD, Sioux Falls, SD, uses MDT's primarily on 854.9625 MHz. And I would never ever EVER admit to being able to decode these transmissions to them face-to-face (nor some of the local FBI people I know).

As an aside: some of their (SF PD) MDT transmissions are VERY unprofessional, and they post the position of every vehicle on patrol about every 10-15 minutes. The local police think these transmissions are secure... I would hate to be the one to dispel that myth, especially on a lonely road after dark.

Hah! Hah!

Kenwood and their nice "form letter" e-mails informed me that there will be no firmware upgrades available.

I sent a personal note to one of the techs and I got a form letter back

stating there were no planned upgrades to the radio. It's sad cause there
ARE some bugs in it (just wait till Dayton and everyone's radios start
locking up due to the massive traffic). Perhaps the newer production models
will get improved firmware, but I don't think they are going to offer it to
the rest of us. Oh well........

Hi Dale,

I have one of each and there is no way I would let the
"kiss mode" effect my decision to buy or not to buy..
IS that the only way you can run your applications?

73!

>I was mistaken in some statements as Mark Fellhauer pointed out. It
outputs in FSK. I misread the manufacturer's info page. The rf modem they
are marketing turns out to be required to bridge their latest laptop based
MDT and their data radios. The MDT-870 terminal apparently has an internal
FSK modem. Maybe there is some way to wire in a TAPR modem disconnect
header and plug in a modem that would be compatible with ham packet
networking. The radio lead is a 25 pin d-sub connecter, so if you had a
pair or a small group wanted to network them, I think it would not be hard
to get this plugged into the data in port on data ready radios like the
Alinco mobiles, etc.

Oh, don't let that stop you. Even with the relatively poor support on
upgrades to the TH-D7A, it is still a GREAT product. The TM-D700A appears
to have all the improvements the D7A needs.

I would buy both radios again in a heartbeat. For what they do, they are
fantastic.

Go buy them and enjoy!

I disagree. I think the D7A is an incredibly innovative product, with
features unlike any ever seen. For what it does, there is no
competition. But it's not "GREAT". It has so many bugs and design
flaws, it's barely usable. Kenwood, at the least, needs to keep
customers happy by offering a $50 or $75 firmware upgrade path. To fix
the insufferable "buttons gone dead because of incoming APRS traffic"
bug I'd easily drop $50. As it is, it is either a tracker, or a
handheld transceiver, but never both.

Will this adversely affect my decision to buy Kenwood products in the
future? Absolutely. Will I let you pry it from my fingers? Never!

There ain't no bleeding hearts on the bleeding edge. Nevertheless,
Kenwood needs to take a lesson from Garmin when it comes to supporting
their products. The customer, after all, is the one footing the bill.

Two things:

1) It's not the fact that it doesn't do KISS, it's the fact that the D7 still has confirmed bugs, but Kenwood has essentially orphaned the early-adopters who have made it a successful product. If the newer units are coming with firmware that isn't available to current users, I'll be DOUBLY upset. Awhile back I heard rumors that new units had a BEEP MINE setting, which is the only way the beep function is useful to me, and if that's true and I can't get an upgrade, I'm not happy at all.

2) KISS mode is very useful - it gets around a lot of the compatibility problems with different TNCs and puts control over communications in the hands of the application program, where it belongs. Frankly, I'm surprised that APRS wasn't designed KISS-only from day one. I need KISS for things like Linux packet networking.

Basically, I don't appreciate paying upwards of $400 for a product that has buggy firmware and then not being able to get those bugs fixed. Can you imagine the uproar if Palm had a policy like this for the Pilot?

73, Tim, K0RUS

I see several people are complaining about releasing products with firmware that is not perfect and they get very upset about it. If the manufacturers were to wait until everything was perfect, then we would never see any of the neat new products, because nothing now days is perfect especially when it is software controlled.

I don't see anyone complaining that Microsoft keeps releasing all their new operating systems which have known bugs built in. Some of which they were not aware of and others that they knew existed but they release it anyway because they are already behind schedule. Look at Windows 98, it was not even Y2K compliant in the original released version. They give you some "free" upgrades at their site, but then they want you to pay for the Release 2 upgrade which fixes their screw-ups and adds a couple of things that I have no need for. This seems to be an accepted practice even though, to me it boarders on fraud, since for us non-computer gurus, we are a captive audience and have to pay and pay and pay.

Kenwood had marketed an excellent product in the TH-D7A and lets give them credit for that. Until something better comes available, I will not hesitate recommending it to everyone with an interest in APRS. Thank you Kenwood for putting out such a fine radio for us to play with. Yes, it has some bugs, but nothing I can't live with. Yes, there are plenty of

improvements that could be added to this radio, but us cheap guys, which
includes the majority of the ham community, would not want to pay for it.
So, lets be happy with what we got.

Yes, Garmin is a fantastic company. I have been with them ever since I
bought my first GPS and would never consider switching. Their FREE software
upgrades are super, but keep in mind that economic reasons forced them into
this free upgrade process. They originally started it to fix problems on
units that would not work properly and they could not afford to take them
all back for upgrades, so they put the info on the web to save money and we
all benefited from that decision.

Long before Kenwood came out with the TH-D7A, I recommended to ICOM to make
a similar product since I was an ICOM man, but their marketing group turned
down my suggestion since they did not feel there was any money to made with
such a product. I certainly hope that Kenwood is making money at it so that
they can develop more of these neat products in the future.

Like I said before: THANK YOU KENWOOD!

Herb, KB7UVC

What I see is people getting upset because there are bugs that weren't
known before purchase, and the manufacturer expresses no intention to
correct them.
I don't see the fact that there are bugs, per se, as the problem.

If you buy a book and then discover that some of the pages are missing,
would you not expect a replacement? You have every right to expect that
this book will contain all the appropriate pages, and not have missing or
mangled pages.

The outrage comes up when you attempt to get the problem fixed, and run
into the "too bad, so sad" attitude.

IMHO, the product should perform as per the published docs at the time of
sale.
I've been on both sides of that one too, so I know what it's like to have
to recall 10,000 units and change EPROMS.

>I don't see anyone complaining that Microsoft keeps releasing all their new
>operating systems which have known bugs built in.

Hopefully not, this is the wrong forum for that sort of problem.

> Yes, it has some bugs, but nothing I can't live with.

Speak for yourself. Others aren't in that situation.

>Yes, there are plenty of
>improvements that could be added to this radio, but us cheap guys, which
>includes the majority of the ham community, would not want to pay for it.

Again, speak for yourself. I would cheerfully pay for enhancements and
upgrades, but asking me to pay to have code fixed that was supposed to be
working when I bought the radio is a bit over the top.

The average APRS user is not a cheap guy. I'd guess the minimum investment
at this point (all new gear) is about $500 to put a TH-D7 and GPS on the
air. My APRS investment is many times that, just in new gear purchased,
not counting homebrew or used gear.

Kenwood has built a couple of excellent radios for us. They also have bugs.
They knew there would be bugs. If they didn't provide themselves a low cost
way to fix those bugs, then that's THEIR fault, as are the bugs.

Given what's available in terms of flash and EEPROM, there's no excuse for
having a product that can't have it's firmware reloaded in the field,
without the risk of turning it into a brick with a bad load. (The loader
code should be permanent memory of course)

My products work that way, and have been for the last 10 years, and I don't
have a fraction of the resources that Kenwood does.

What is wrong with KISS mode? My D7A from April (1999) worked okay under
Linux last time I tried it. The buffer is a bit small (256 bytes, I
believe) but I was able to work around that by making a smaller MTU. I did
discover, however, that the deviation was quite a bit to low on both 1200
and 9600.

Does KISS mode in the D700 work correctly? I haven't had a chance to test
mine yet.

As an example, I'm working on an advanced doppler DF rig at the moment.

It gets it's firmware from a PC paralell port with five wires and a loader
program on the PC.
There's nothing you can to to it (short of electrical/mechanical damage)
that will prevent it from taking new firmware.

I know I will have bugs. My customers will be able to load new firmware
themselves, in less than a minute, delivered by email or pulled from a web
site. If they don't want to do that, then they can mail the rig back to
me, and I'll load it for them.

So I know whereof I speak, when I say that Kenwood could have done this too.

Is there a replacement antenna available for the THD7A that works and does
not require an adapter. The OEM antenna seems to be little more than a
dummy load. (The comment is not intended to be Kenwood bashing.)

I dont think KISS mode was ever marketed as a feature of the THD7. IN
fact, I dont think any version of APRS supported KISS mode back when the
THD7 was announced.

Interesting that your deviation was too low. Mine is a little too high. Almost 4 kHz on 1200 baud packet. Does anybody know if it's adjustable? I'd like to try to see how much better the D7 works at 3 kHz. My mobile worked a lot better when I cranked it back to 3 kHz.

I was at a hamfest yesterday and looked for antennas. All I saw was a wimpy looking antenna (MFJ I think) with an SMA on it. The rod diameter was less than half that of the standard Kenwood antenna. I can't see that that would even be as good. Especially if you're trying to do any out of band receive. The smaller the antenna, the narrower the bandwidth. I've compared tx & rx on my D7 to my Icom W31 and the W31 receives much better. Both show about the same rx sens on a service monitor. Guess I'll look at Dayton for an antenna. I'm not going to buy an antenna without trying it first. A couple years ago I was going to try a dual band "Gain antenna". I dialed up a repeater that was a little distance from the hamfest where I was. The repeater was fairly noisy and I had to move around a bit to be able to key it with the standard antenna (my W31). When I tried the "Gain antenna", I couldn't find any place where I could get into the repeater! So much for that gain antenna!

Comet has a 3" SMA duck that works at least as well as the stock one. MH209SMA is the number. It's almost identical to a Maldol Active Hunter, only with the SMA connector.

They also have a skinny 17" whip, the SMA24,and a 9.75 SMA3. All are dual
band. I have the first two, not the third. There are several other listed,
too..

Go to the AES page, www.aesham.com/cmt.shtml, and FIND (ctrl-F) on SMA.

73,

Chris

Actually, I think providing for flash upgrade should be something that
Kenwood (and their competitors) should pay attention to. It partially
solves the catch that Kenwood is in for fixing bugs without having to deal
with massive product returns. You will never fix all bugs in a particular
product, but at least with flash you can provide an easy upgrade path, as
long as you have engineers to support it.

Just too late for D7 and D700.

The comet SMA whip is what I've been using for the last couple years. About
8x the gain (3x the range) of the standard helical dummy load.

I was speaking in the general case, not to any specific issue.
However, if the manual says it will do kiss, then I expect that to work.

If I buy a car, and there's an accessory I wasn't aware of at purchase,
which does not work, I'm entitled to get it fixed, no?

I've been thinking about this. I wonder if one reason might not be type acceptance. Any radio that could be flashed by the owner has the potential (however remote) to have the image reverse engineered, and then changed to make the radio function in non-approved ways.

OTOH, this could make being a radio manufacturer really easy. Just stock unprogrammed chassises in different bands, and squirt in an image for what ever the customer wants to buy. I bet a single model could easily handle 2m, high band, and marine band...

On Mon, 27 Mar 2000, Busch Thomas H CNIN wrote:

Then they need to make the compliance parts part of the permanent or
"factory only" set.

It's a long dual band whip, but I don't know the specific model number.
It's been a while, and there's not enough room on the antenna for a part
number.

I want to listen (watch) pacsat packets on my mobile D700. I believe the
only way I can do that is by connecting a laptop to the RS232 port, and
watch the packets on the laptop screen, right? I wonder if there is
something I am missing. Is there a "screen" of the D700 that I can use that
will show me the raw packet data of a PACSAT?

thanks in advance,
Rich Parry, W9IF

Funny, I keep hearing about this "bug" and I have had my D7 for over a year
now (it was one of the first few regular production models with the, then,
"new" firmware) and it has been used in some fairly heavy APRS traffic areas
in NJ as well as up here on my mountain where I can copy Montreal on the D7
and I have yet to see it happen.

> Will this adversely affect my decision to buy Kenwood products in the future?
> Absolutely. Will I let you pry it from my fingers? Never!

 You have about the same chance of getting my D7 or my D700 from me. And I
plan to pick up another D7 next time someone has a a good sale (I have been
hearing prices under $400 already)

 In the same menu that has LIST MSG et al. is P.Mon - that will let you
monitor raw packets and if you hit HOLD you can scroll back up to 10
screens.

Sure, just put it in APRS mode and set it to 9600 baud. Then tune in any
of the 5 9600 baud satellites. Tune for doppler and best sounding
"ssSsSsS" sound and tthen hit P.MON

You will see all the UI packets on the screen. (and FAST!)

ANother thing you can do is set your APRS Message Gropup to a wildcard of
"*" and then any packet that just happens to look like an APRS
message packet will be captured as a message. There is one particular
Telemetry packet that will get captured this way about once every 20
seconds or so..

FInally, come join us on the APRSSAT SIG and find out more...

Due to the volume of requests for the vendor's contact info, I'll post it again here:

Twin City Surplus
1675 E. Fourth St.
Reno, NV 89512
1-888-323-5630.

I was mistaken in some statements as Mark Fellhauer pointed out. It outputs in FSK. I misread the manufacturer's info page. The rf modem they are marketing turns out to be required to bridge their latest laptop based MDT and their data radios. The MDT-870 terminal apparently has an internal FSK modem. Maybe there is some way to wire in a TAPR modem disconnect header and plug in a modem that would be compatible with ham packet networking. The radio lead is a 25 pin d-sub connecter, so if you had a pair or a small group wanted to network them, I think it would not be hard to get this plugged into the data in port on data ready radios like the Alinco mobiles, etc.

>I dont think KISS mode was ever marketed as a feature of the THD7.

Surely the point is that, if the TH-D7 has a KISS command available, it
should work? Although how important that is probably depends on which
side of "the pond" you live on.

I get the impression that KISS not working is not at all important for

the USA market. When I first got hold of a TH-D7, and found that KISS
didn't work, I read all the various reviews of the rig that had been
published in the USA, and couldn't even find the word KISS!

In Europe it is much more important, because there is a wide range of
excellent packet software that uses KISS, and also hams buy the rig to
use for packet purposes other than APRS.

>IN fact, I dont think any version of APRS supported KISS mode back when
>the THD7 was announced.

What is the relevance of whether APRS supports KISS to the fact that
KISS in the TH-D7's internal TNC is broken? Or are you saying that
Kenwood regard the functionality of the TH-D7's internal TNC as only
being good for APRS use? If that is the case, then their marketing of
the rig over here has certainly never given that impression.

No, I'm not Kenwood bashing! The TH-D7 is a superb, innovative rig.
However, it has a very obvious fault and the best solution would be for
the manufacturer to fix that fault free of charge, learn from the
experience, and move on from there. One thing they could perhaps learn
would be to get similar rigs tested by users who are going to subject
them to a wider range of packet use than just APRS, *if* they regard the
TNC in the rig as being suitable for a wider range of use...

> Hi Dale,
>
> I have one of each and there is no way I would let the
> "kiss mode" effect my decision to buy or not to buy..
> IS that the only way you can run your applications?

Two things:

1) It's not the fact that it doesn't do KISS, it's the fact that the D7
still has confirmed bugs, but Kenwood has essentially orphaned the
early-adopters who have made it a successful product. If the newer units
are coming with firmware that isn't available to current users, I'll be
DOUBLY upset. Awhile back I heard rumors that new units had a BEEP MINE
setting, which is the only way the beep function is useful to me, and if
that's true and I can't get an upgrade, I'm not happy at all.

2) KISS mode is very useful - it gets around a lot of the compatibility
problems with different TNCs and puts control over communications in the
hands of the application program, where it belongs. Frankly, I'm surprised
that APRS wasn't designed KISS-only from day one. I need KISS for things
like Linux packet networking.

Basically, I don't appreciate paying upwards of $400 for a product that has

buggy firmware and then not being able to get those bugs fixed. Can you
imagine the uproar if Palm had a policy like this for the Pilot?

>I get the impression that KISS not working is not at all important for
>the USA market. When I first got hold of a TH-D7, and found that KISS
>didn't work, I read all the various reviews of the rig that had been
>published in the USA, and couldn't even find the word KISS!

That might be true if you do not want to work the Amateur Radio
Satellites. Most of the packet programs for satellite communications
use the KISS mode. In fact, there are several other packages that
require the KISS mode right here in the USA. So, it really depends
on how you want to use the Kenwood. I think of it as a portable radio
and not a digipeater or a digital node so the only place I am going
to use KISS is on the satellites.

KISS would be nice to have on the road since I am an active
Amateur Radio Satellite enthusiast. However, to successfully uplink
and downlink at 9600 baud on these satellites the radio and TNC
must work in full duplex mode. The TH-D7A does not do this when
the TNC is activated. It would be nice, but that was not the total
reason I purchased a TH-D7A. If it had full duplex operation with the
TNC and the radio simulataneously, it would take a very big crow bar
to pry this little baby from my hands and you would not succeed.

The TH-D7A will not work APRS in the 9600 baud mode as a stand
alone unit, nor can you set the unit to 9600 baud without a computer
or some other devce to send the proper commands to configure it
in the 9600 baud mode. This was a disappointment, but it was not
the total reason why I purchased a TH-D7A. I have heard about some
possibe changes in this area, but I have not seen it.

I purchased a TH-D7A for 1200 baud APRS work and to have a nice
dual-band HT. It works quite well in that respect. It is still an
excellent
radio with a built-in TNC. Considering that Kenwood is leading this
area at the moment, I have heard very little from the other suppliers
in the Amateur Radio world who are moving in this direction. If they
are doing so, they have not made it known to the general population.

Would I give up my TH-D7A. NO! Even despite the fact that t locks
up every once in a while under heavy APRS reception. Just take
it to the Dayton Hamfest, leave it on an APRS frequency, and you
will see what I mean. It can be annoying, but I do not walk around the
Dayton hamfest every day either.

>No, I'm not Kenwood bashing! The TH-D7 is a superb, innovative rig.
>However, it has a very obvious fault and the best solution would be for
>the manufacturer to fix that fault free of charge, learn from the

Yes, it is a superb unit. I worked several stations via UO-14 and
SO-35 in the FM voice mode using a rubber duck on the unit for an
out of this world experience. Connect an ARROW dual band handheld
beam and you have a big rig station for satellite use.

Technology changes and the prices change along with it. I got my

TH-7DA for $439.00 over a year ago. Then, I went to Dayton and
some of the other hamfests and found them for less than what I paid
with added extras like extra battery packs and external microphones. I
did not get these free with mine and felt a little deprived, but we live
in a world of competition and changing technology. When you purchase
a computer, you know it will be old technology in six months and the
operating system will be replaced every 2 years with something better
or at least it should be better. Do you expect the supplier to upgrade
your software for free every time a new feature or bug gets fixed?
Granted some software suppliers fix bugs and Kenwood also fixed
some issues with the earlier units like mine. Did they have to? No,
but the fact that they did was great!

Kenwood: When you come out with an upgraded TH-D7A with the
following additions, I will buy it:

1. Full duplex TNC and radio.
2. Field upgradeable FLASH memory by the user.
3. APRS functions working with 9600 baud like the 1200 baud mode,
    so I can use it on the satellites with 9600 baud APRS beacons.
4. Memory for my own canned messages that can be selected and
    sent from the HT without having to type them on the pad.
5. KISS mode. I thought it worked, but I have not tried it yet because
    it does me no good without the full duplex TNC and radio setting.

Nobody answered my question,

What is wrong with the KISS mode? I have successfully used my year old unit
with the Linux AX.25 utilities, under kiss mode.

The entire reason I bought the radio was because I saw Bob receiving the
PACSAT's in KISS mode at DCC in Chicago.

> PACSAT's in KISS mode at DCC in Chicago.

Sorry if you were misslead. I never operated the radio in KISS mode and
always stressed that I was operating it in normal packet receive only
mode.   The radio CANNOT OPERATE CROSSBAND TNC. THis was stressed at
DCC more than 3 months before the radio was announced. So even if it had
a KISS mode, it would be useless for trying to do PACSAT-PROTOCOL with the
pacsats.

I always demonstrated how it could receive all BEACON, STATUS, TELEMETRY,
PBLIST, LSTAT, and all the OTHER pacsat UI packets in normal packet mode.
THese occur many times a second. ALso these UI packets are what we
anticipate will be very useful for Space Applications of APRS. RIght now
there are 5 sats you can copy these packets from: UO22, KO23, KO25, TO31
and SUNSAT.

You will see several of these UI packets per second from the PACSATS .
We also expect in the near future for one of these satelites to have DIGI
enabled for mobile-to-mobile APRS communications using the front panel of
the D700 radio. The THD7 in this regard can be used with any version of
APRS to monitor the downlink and see everyone. The D700 will not need a
laptop, since it can communicate 9600 baud APRS from the front panel. The
existing THD7 will need the laptop.

In summary, the radio cannnot operate crossband TNC, so the point about
KISS was moot for PACSAT operations from the git-go...

I won't claim any mystic insight, it's the same approach I've employed
since '83 for compliance with telco regulations in multiple countries. The
customer-accessable variables are never allowed to go out of compliance
range. This dosen't preclude them from using the same chassis into
different markets, they just need to make the compliance block more
difficult to change, and leave the rest open to casual reload. The part
that does the loading should always be in permanent memory, and you always
look for the "magic handshake" on powerup to see if there's a new load
coming.

(Shades of the agrelo foxhunt transmitter firmware. Too bad the product
went down with the ship.)

It's frustrating that KW is so good at the other aspects of the design, and
left this end hanging so badly.

```

The key combo should be (F)(1S)(TNC). The TNC button should appear as the 4th button on the left side.(bottom) This is a toggle to the 3 modes for the TNC.

Mode 1-No TNC Functions(serial port still functions for radio control)

Mode 2-APRS TNC
    The APRS indicator on the lcd will come on. APRS functions are controlled by the internal processor using the settings you put in the APRS and TNC sub menus. ie: call, status, tx rate, gps ect.

Mode 3-TNC mode. This functions as a TNC-2 clone for use with Mac/Win/Dos/Palm ect APRS. GPS data will be allowed as a "GPS on second serial port" option in most APRS versions under the D7 TNC. Some settings are controllable by the panel. ie baud rate.

As of yet I do not know of any APRS versions that function with the D700 while it is in APRS mode. It is something that I would like to work on if I had the time and more programming experience. This would really be an ideal situation, a semi passive software package that could display maps and give better message input ability while stationary. It could possibly be easy to do, I have to do more research. I am getting pretty good inputting messages into the D700 with the mic without really looking. But a terminal would be nice for public service work, or waiting for the YL in the parking lot.

Is anyone working on this at the moment? I could see using an I-opener with a touch screen as a real nice MDT for APRS.

Dennis, N2LBT

Set the command DIGIPEAT to ON

Assuming you want the digipeater to act as a RELAY digipeater, set
MYALIAS to RELAY. Assuming it's otherwise set up for local packet
operation, you're done.

73 and have fun

>From the Kenwood TH-D7a instructional manual:

Commands supported by the built-in TNC:
GBAUD   GB   4800/9600

Selects 4800 or 9600 bps as the transfer rate between the TNC and the GPS
receiver.

The TH-D7a Manual Addendum for GPS connection simply states to put the
Garmin GPS receiver in NMEA 4800, which is simple enough. But as the manual
states there are settings of 4800 and 9600 within the TH-D7a, does it auto
select (not likely if there is a program to change it) or default to 4800
on startup? Without a PC how can I tell that the setting is at 4800 or
change it if it isn□t? Wondering if there is a selection why doesn't it
show up in the TH-D7a regular menus?

This seems to be the mode to use with APRStk. But when I set
the B side to "Data" for receiving satellites, then all I/O goes
through that side. The first satellite pass causes the B side
to switch to 9600 baud and it remains there even after the satellite
passes and the B side goes to 144.39. Of course, this kills
the APRS copying mode of the program unless I use O-C-T and
set the hbaud back to 1200 by hand. But then the next sat
pass will cause it to be stuck at 9600 again.

I don't understand what part the A side plays in APRStk --
once the B side is set up as the data receiver, the A side
seems to play no part in the program.

This is a known bug when using the D700 with APRStk. (ill fix it when I
get mine hooked up). But it should not be a problem with the D7. My D7
qsys back and forth and changes the HB rate too...

The SUBJ line of the message says D700, but the original post was tlaking
aobut a D7... can you confirm..

Yes, I was writing about the D700 although the original message was
about the D7. The procedure for setting the TNC caught my eye and
I realized it was the same for the D700.

Is it correct for the B channel to be doing all the work for
APRStk after it is set for DATA mode? I can see 144.39 packets
being copied on both A and B but the computer only sees the
B channel (which has the 9600 'bug').

This is an exciting system and I am anxious to copy some satellite
transmissions. I get information on the List-Users page relating
to the satellites but I don't get any packets on the List-Telemetry
page.

Yes. Only scratching the surface of the potential here, but it's a start.

> This is an exciting system and I am anxious to copy some satellite
> transmissions. I get information on the List-Users page relating to
> the satellites but I don't get any packets on the List-Telemetry page.

Yes, LIST-TELEMETRY is for "APRS" formatted TELEMETRY. Until yesterday
none of the pacsats used that mode...(can say no more for now... grin)

Hit LIST-PACSATS and that is where you will see the HEX telemetry from

the PACSATS...

Hit LIST-USERS to see who was using the bird...

Hit BULLETINS to see if any of the satellites are sending APRS bulletins

Stay tuned over the next few weeks for exciting new developments...

295. [htaprs] SUNSAT PASSES

From: "Peter ZR5DWC" <zr5dwc@iafrica.com>
Date: Thu, 30 Mar 2000 23:27:01 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-74484-2000.03.30-15.25.28--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All here are the passes for sunsat. It is in mode B ie: uhf up vhf down

145.825
436.290

South America:

29 March	00:07
31 March	23:46
2 April	11:25
5 April	00:25
5 April	23:44
6 April	23:05
8 April	12:26
9 April	11:46

USA:

28 March	03:52
29 March	03:12
30 March	02:32
31 March	03:31
1 April	14:03
2 April	13:25
5 April	03:30
6 April	02:50
7 April	02:09
8 April	14:22
9 April	13:42

Morning passes will probably be changed to evening passes as the
orbit changes, as morning passes become too early.

296. [htaprs] Programming cmds for Memorys for D700

From: "Karl G6ODT" <g6odt@btinternet.com>
Date: Thu, 30 Mar 2000 23:56:52 +0100
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>

Rendered body type: text/plain

Hi ,

As I dig deeper while developing my D700 control software
I'm looking for some more infomation.

When switching the radio to memory mode does anybody
know how to get the radio to report which memory channel
it is now using ?

I know how to get the name assigned to a memory channel but
first I need to know which memory the radio is using.

Also still looking for a cmd to send to the radio to make it thing
the OK button has been pressed or for that matter if there exists

a way to emulate any button then it could open a few ideas.

All help gratefully received.

297. [htaprs] APRStk version K10

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 30 Mar 2000 18:57:07 -0500 (EST)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-74511-2000.03.30-17.57.57--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRStk does two things. It can serve as an automated APRS and
VOICE satellite ground station while automatically tuning the
Kenwood radios to satellites in view, or it can serve the wider community
by letting one copy run in each major APRS wide area. On 144.39 then, it
does these things:

1) Transmits Satellite OBJECTS on 144.39 whenever one of the satellites
that are workable from your mobile or HT are in view. There are 7 you
can receive and several you can transmit to..

2) Once every 10 minutes transmits out a DX-SPOT to all THD7 or D700's
alerting everyone to any satellites that will come into view in the next
80 miuntes.

The beauty of this is that a mobile THD7 or D700 user needs no prior
knowledge to work one of these satelites. If he sees UO14 pop up on his
radio front panel, it will show the AZIMUTH, DISTANCE and FREQUENCY of the
satellite. When it gets closer than say 1000 miles he can work it with
his 2m mobile whip. If he has a handheld beam, he can work it at 1500
mi...

APRStk version 10 has been posted. It fixes two things:

1) It fixes the bug with the D700 that would not QSY back to 144.39
2) It knows the difference between day and night and will not uplink
   AO27 at night when it is off.
3) It separates SO35 into a digital and voice bird so that the separate
   modes can be separately handled.

Finally copied a hex string from a satellite with APRStk!

>
> Hit LIST-USERS to see who was using the bird...

Got that list, too!

> Hit BULLETINS to see if any of the satellites are sending APRS bulletins
>
> Stay tuned over the next few weeks for exciting new developments...

I downloaded version 10 of APRStk and looks like it is
working great. Switched to 144.39 at 1200 baud like a charm.
Just though I'd let you know....

Haven't gotten any verification of this feature yet. I've got
version 10 of APRStk running and looks great so far.

Rendered body type: text/plain

Hello all,

I have no connection with these guys, but at lunch today I bought a
Mitac MetroGuide Car Navigation System which includes a Mitac GPS, MAPS,
RS-232 cable and software all for $50.00 from Software & Stuff in
Sunnyvale (www.softwareandstuff.com). They had about 20 units in stock
when I was there. Again I have no connection to these guys but it
seemed like the best deal I've seen in a long time.

Rendered body type: text/plain

This may be just the thing folks have been looking for.

Go to http://www.bb-elec.com/product.asp?dept%5Fid=80&sku=FA1%2DE
to see a device that inserts between a computer and it's keyboard, which
has an RS232 port which can talk and listen to either of those two. And you
don't even have to have the computer present, it will serve as a keyboard to
serial adapter. From their description:

. Serial ASCII Keyboard - This maps the AT keyboard keys to a simple ascii
character set which are sent to the RS-232/RS-485 port. This can be used
to create a simple ASCII RS-232/RS-485 serial keyboard. It can also make
monitoring keyboard usage easier.
. Serial Keyboard - Convert a keyboard to a serial RS-232 or RS-485 device.
This can be used for systems which don't have an AT style keyboard port, but
still need a QWERTY style keyboard.

Or you can use it to add a serial port to a laptop (for your GPS maybe):

. Attaching Input Devices - Connect RS-232 and RS-485 devices to a computer,
such as bar code scanners, magnetic card readers and measurement devices.
This way no communications ports are needed and the application can read
the input just as if it came from the keyboard

The functions above are available in the standard version which sells for
$99.
There is also an EEPROM version ($150) that can do these added things
among others:

. Store and execute key strings - The Keyat FA1-E can store key strings up to
31 characters in length in non-volatile EEPROM memory. The Keyat FA1-E has
memory for 32 strings. These strings can be executed either automatically or
with a command.
. Chain stored key strings - The Keyat FA1-E can chain together stored key
strings, to allow long key sequences.

***

And just for grins, look at their WristPC keyboard. Just the ting to get
yourself
fully wired. 40 keys, all alphas, numerics, and arrow keys; fully sealed; USB
interface: http://www.bb-elec.com/product.asp?dept%5Fid=97&sku=SA0013

***

I'm not affiliated with B&B Electronics, I'm not even a customer of theirs -
yet.

73,

Tony KD7CEJ

Rendered body type: text/plain

Perhaps I missed it. This seems like such an obvious combination, someone
must have done it.

Is there a Palm Pilot program that will control the Kenwood Th-D7 and
also work as a packet or APRS terminal? Maybe the pocket APRS software
will do this, I have never used it. I'm trying to find a good enough
reason to spend the money on a PDA.

Any Ideas, suggestions?

Rendered body type: text/plain

Can the D700 in APRS mode be set so that the digipeater
responds to Tracen-n ?
It says in the manual about using it in Packet mode and
tells you how in APRS mode to set the packet path for
Tracen-n and Widen-n but from the wording it doesn't
say that it will work as a Tracen-n digipeater in APRS
mode.

If it can what is the correct entry ?

Rendered body type: text/plain

Maybe I'm just getting old but I have been unable to figure out how to
get the Kenwood D7A memory control program (Version 1.10) or KD6VYV's
program to talk to or enter frequency lists from the ARRL's Travel Plus.
Since I am a lousy typist with big fingers, who is using the radio on my
Motorcycle, I would like to be able to pull up a list of repeaters prior
to a trip and program them in from my computer with the names of the
towns (truncated if necessary). That way I can try to find a local
repeater relatively easily without having to try to enter things while
rolling along the road..
So far I've typed in the list and saved it for latter if I felt I would
be going that way again.
Any help would be appreciated.

I've used PocketARPS quite successfully with a D-7 and a Palm Pilot IIIxe.
I plug a pharos GPS into the GPS port of the radio, and the radio passes
it on to the palm. You will need to get a Palm hotsync cable and modify
it to connect to the radio, but this is not a major undertaking.

I'm looking for opinions.

I'm at a fork in the road, deciding whether to go to the Windows CE camp or
the Palm camp. I want a handheld device to use primarily for 1.) mobile
APRS use and 2.) e-mail processing via modem. With the recent introduction
of APRS/CE and of color Palms, it looks like I can go either direction.

Anyone have any personnal experience or recommendations?

If you decide to get a Palm, look at the TRGpro - www.trgpro.com. It has
a compact flashcard slot, which means it can hold lots and lots of maps.

Message-ID: <LYR845-75210-2000.04.03-10.40.40--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This is NOT for public announcement.   It was posted on the aprssat sig,
but since it applies to all D700 mobiles, then I figured I can safely post
it here also...   Please keep off other lists...

If these tests are successful and the South Africans decide it is worth
the political heat, then we may get ourselves a satellite digipeater VERY
soon..

BOTTOM LINE: If you have a D700 mobile, be sure to tune in 436.250 MHz
at 9600 baud APRS tomorrow at 0942 EDT 0842 CDT and see what you get.

de WB4APR

Here it is guys. APRS Satellite!!

TOmorrow, Tuesday and Wednesday mornings. 0942 EDT on Tuesday.

So set up your Mobile TMD700 for 1 minute POSITS and post a message or
two. Remember to set your APRS MSG GROUPS to include a "*" wildcard
and send your message to BLN# so all can see. Remember you have to
off-tune the downlink for a second to get your transmitter to see a clear
channel to transmit.

If you have a WISP station, PLEASE log a KISS file for them. That is what
they really want... a means to capture their image data worldwide... Here
is what they sent me:

As during the previous test, APRS status and telemetry broadcasts, as
well as UI broadcasting (this time of a high resolution image
fragment) will be active during your 13:42:11 UTC pass tomorrow. (Tues)
Additionally APRS digipeating (with callsign substitution), generic
digipeating and APRS test bulletin will be enabled. For generic
digipeating you may use SUNSAT (with any SSID as the digi call); for
APRS digipeating use APRSAT-0 (any SSID should do). The uplink will
be 145.825 MHz and the downlink 436.250 MHz. Wednesday's pass will
contain more of the same (depending on the success of tomorrow's).

For details on setting up your D700 see my ASTARS page:

http://web.usna.navy.mil/~bruninga/astars.html

10. [htaprs] Re: APRS Satellite Test

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 3 Apr 2000 19:50:34 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-75313-2000.04.03-18.50.50--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For the test, do NOT expect to hear your own packets. The Satellite is
operating full duplex and you are half duplex (plus you had to QSY to get
the BUSY to clear long enough to send) so you will NOT capture your own
packets.

SO dont just keep blindly banging away. Set for a 1 minute rate and we'll
see later what happened.

If anyone is using their D700 or THD7 with their IGATE station, then its
OK to IGate this to APRSERVE.... But again, no public announcement. This
way APRServe will capture what we need.

Setups for your D700 are near the bottom of my ASTARS page:

   http://web.usna.navy.mil/~bruninga/astars.html

Use the DIGI call of SUNSAT and add "*" to your message groups if you
want to see everything...

Bob, WB4APR

If you decide to get a Palm, look at the TRGpro - www.trgpro.com. It has
a compact flashcard slot, which means it can hold lots and lots of maps.

Rendered body type: text/plain

I'm a PSION Serie 5 user and want to know if anybody has done APRS mode with
D7 / D700? I don't like to change my PDA ;-))
For PSION 5 the "street planner" and the "route planner" is available in
combination with a GPS device. So it should be possible to route the output
from a D7 / D700 via the serial line into the PSION 5 .....
Any ideas or experiences?

Thanks

I got a hold of Pharos by calling them directly. Their GPS is a nice
little unit and seems to be just as sensitive as my 12XL. If you don't like
the PS2 power connector, replace it with a universal type.

Ordered a PHAROS iGPS-180 last Friday via telephone, arrived yesterday (Monday)!
I recommend phone order. Several on this list gave good experiences with this
unit/vendor and offered pinout for connectors to modify cable. They only have
grey units in spite of web site mentions of colors. Great small size for very
portable trackers, etc. No mounting method supplied, but small velcro will hold
to dash nicely. Documentation very sparce. Single unit price presently $125. I
recommend getting the $14.95 cig. power cord. It's a good buy with nice rubber
coiled power cord and the small regulator board inside cig. plug for building
even smaller power adapter to capture HT or other tracker power source. Without
it, remember the GPS unit works on 3.5-5.5vdc @ 170ma and comes with pigtail off
of DB-9 computer connector to plug into mouse (PS-2 mini-DIN male) port for
power. Both easily cut off and customized for compact setup. This GPS with
TH-D7 & Palm Pilot seems like the smallest full featured 'system' you can build
today. (Unless you go display-less with a MIM board and a Alinco credit card
radio!) Have fun. -Ken- KD3VK@amsat.org

Here is the detail report....
Here is my report of the first SUNSAT APRS test at 1345z on Tuesday 4
April. It worked! The results below only report on the ASCII/APRS packets,
not the downlinked Image KISS data. This was a 26 deg max-EL pass to
my west.

SETUP: I had 4 stations receiving. Only my mobile was transmitting.

  1) Kenwood THD7 HT connected to 20" whip on roof with preamp and 150
     feet of coax. HT being autotuned by APRStk
  2) Kenwood TMD700 with OSCAR array running HYPERTERM and capture file
  3) Kenwood TMD700 to 20" whip outside window with 20' coax
  4) Kenwood TMD700 in my car connected to a 2m mobile (5/8 wave ant).

SUMMARY:

  1) HT received 27 packets: 3-TLM, 4-TEST, 9-BLN, 8-STS, 0-other
  2) OSCAR station received 24 pkts: 3-TLM, 4-TEST, 7-BLN, 6-STS, 4-other
  3) D700 on whip received 18 pkts. 6-TLM, 2-TEST, 5-BLN, 5-STS, 6-other
  4) D700 in car captured SUNSAT and W5ACM. No packet count available

COMMENTS:

   THe SUNSAT STATUS and TELEMETRY packets were in the correct APRS
format and were captured by all stations. The TEST message and the
Bulletin messages were not. THus they were not captured by APRS software.
They were missing the :BLN#_____: at the beginning of each line of text.
I was not in the car to see how many packets were displayed on the mobile
front panel since APRS only retains the LAST STATUS from each station.
That is why multiple line information must use the BULLETIN format.

The STATUS line of the mobile display is only 28 characters long and so
the SUNSAT status line shows as [OBC1v3: Tue APR 4 13:46:39 2] and is
truncated beyond that. The single digit DAY (4) allowed one more digit to
be displayed on the end ("2"). It might be worth changing the order of the
data to show more meaningful data in the first 28 bytes.

SUCCESS RATE:

   At the risk of drawing a conclusion, the uplink success rate appears
less than we have noticed on UO22. My mobile only got in once (it was on
a 30 second retry). This could be because of the wide announcement of
this test to a larger number of testers (the private APRSSAT group) and
therefore congestion on the uplink. ALthough you do not see but 2
stations successfully digipeated (W5ACM and NOCALL(me)), there could have
been many dozens trying, and being their first attempt at 9600 baud cross
band via satellite, they could have had all kinds of setup errors. THus
they were transmitting RF on 145.825, but none of it was correct to be
digipeated, yet still providing QRM. I can attest that there was
at least one user within line of sight of my station that was uplinking on
145.825 using 1200 baud...

Below is the capture file of the OSCAR station using HYPERTERM. It begins
with a KO23 pass just to verify our setup. Then proceeded to capture
the SUNSAT pass. The TNC only captures ASCII PID=F0 packets since it was
not in KISS mode.

I was listening to the bird but could just barely hear it on the D700. It
wasn't a strong enough signal to even show on the Smeter here in the middle
of KS. The problem may have been my 5/8 wave (on 2 mtr) dual band mobile
antenna has too much gain. IF I can listen again tomorrow, I'll try the
little 1/4 wave dual band. Knowing the duration of the pass would be good
too.. Since I will soon be traveling alot, I'm really interested in this
bird's capabilities.

See http://www.heavens-above.com/ . You can either look up your location in
their database or enter the coordinates manually. After you've done that,
you can bookmark the page so you can get back to it quickly.

Once you are on that page, you will find a link to click that will give you
"24 hour predictions for radio amateur satellites (all passes)." Of course
you can bookmark this page as well.

Don't know if this has been posted before...

Pharos is developing a CE-based device with GPS that looks interesting for
mobile use .... a small, color tablet capable of displaying maps. Don't
know if you could tie APRS to it, but if you could (there MUST be a way),
this could be THE PRODUCT for mobile APRS use in my opinion.

>From their website:

"iRudolph is the first Windows CE based portable navigation and
communication computer with a removable mass storagedrive --- Clik!. It
integrates a high performance micro controller, a 5.7" color LCD display, a
Clik! from Iomega, and a GPS receiver based on SiRF GPS technology. Its
open architecture design makes it easy to expand and to adopt third party
solutions for Windows CE devices. iRudolph will be available in the
beginning of spring 2000."

More APRS Satellite testing on Wednesday...
If you need help setting up your TMD700, see bottom of:
http://web.usna.navy.mil/~bruninga/astars.html

de WB4APR, Bob

From: Johann Lochner (SUNSAT Team)

Hi Bob,

Once again, thanks to you and all others who
participated in today's test run. We'll repeat the
test during your 13:01:45 UTC pass tomorrow (WED at 0901 EDT
which will be over the East and CENTRAL USA). The BLN
format will be sorted out (hopefully). It will be
appreciated if you (or someone from your
APRSSAT testing group) would log KISS frames tomorrow
(we can extract all APRS and other data from these).
Please also zip the binary data before forwarding it
by e-mail.

Regards,
Johann

Sorry, nothing heard here on 436.250 MHz on the Wed morning 1305 UTC
scheduled pass for the SUNSAT APRS test.

Something must have gone wrong on the satellite's onboard schedule...

Sorry,
Ill let you know when I hear of another UNPUBLISHED test...

You see now why they dont want to make a public announcement until all the
wrinkles are worked out.... :-)

Is there any more detailed information with regards to location and timing
of DCC 2000? TAPR's web site says "Orlando (Tentative)" with no date,
though I suppose mid- to late-September is a reasonable guess.

Orlando is a popular place, especially in the fall, and I'd like to be able

to book early and spend some vacation time down there before and/or after
the conference.

Thanks in advance.

APRSSAT group,
See you tomorrow morning for one more try. Then we may just have a
permanent APRS satellite! See message to follow. But again, no public
comment until the SUNSAT team makes their announcement...
Besides APRS, though, they really do want some people to use KISS mode in
WISP to capture the raw image data that is also coming down...

Subject: Re: Sunsat testing continued

Hi Bob,
Had a look at the diary uploaded for today's pass: the time was
incorrectly entered. Sunsat only came on at 13:15 UTC. Sorry about
that. We'll repeat the test during your two morning passes tomorrow:
12:22 UTC (38°) and 14:02 UTC (17°). When all services (including
the UI broadcasts) are tested, we'll probably let the digipeating run
permanently (except for the short periods when the analog repeaters
are enabled).

Regards,
Johann

Rendered body type: text/plain

I'd like to see someone do a TEST with their D7/D700

What is the relative RF signal required for reliable PACKET recovery
between 1200 baud AFSK and 9600 baud FSK?

If they were both FSK with matched filters, then presumably the 1200 baud
would do 9 dB better. But we all know that AFSK is WORSE in a weak
signal environment AND There are some abominable 1200 Baud packet signals
on the air.

Previous tests of this age-old question were apples/oranges tests, because
each radio was home brewed to its own 9600 baud interface and that was
different from the 1200 baud audio path. In the KENWOOD, we have a
consistent radio, all manufactured to the same specs, and all tuned at the
factory, and with supposedly optimum settings for both modulators and
demodulators.

Based on my 9600 baud listning experience over the last several months to
the WEAK satellite downlinks, I'm beginning to think that the radios will
do 9600 baud with a weaker RF signal than they will with a 1200 baud AFSK
one.

Does Anyone want to take the time to do a GOOD quantifiable test?

Rendered body type: text/plain

SUNSAT APRS Success! (Still not for public release...)

During the 38 deg East pass over Maryland (satellite over the Atlantic),
at 1222z on 5 APR 2000, we captured 86 APRS packets during 11 minutes
demonstrating Mobile/Handheld Satellite message capability! We used 4
stations:

PKTS	STATION
86	OSCAR Array with Preamps and high gain antennas (manual trk/tune)
92	THD7 with 20" whip over groundplane (auto tune with APRStk)
*9	THD7 with stock rubber duck on table (no tune. Set on center freq)
*3	MOBILE D700 with 5/8 2m whip on "plastic van roof"

Of the 86 packets received, 45 were SUNSAT TLM, 15 were SUNSAT STATUS,
12 were 4 BULLETINS, 11 pkts from WB3ANQ-9 and 3 pkts from W3ADO.

First, notice that the THD7 with STOCK rubber duck sitting on a table
captured ALL 9 of the Bulletins and Messages. THus clearly demonstrating
handheld Satellite communications. Even unattended. If you are in the
wilderness, just set it in the clear and come back for your messages
later!

Second, Notice that the THD7 with 3/4 wave 20" whip and autotune captured
as much or more than the OSCAR array even though its performance on
the horizon is less. This was probably due to the autotuning and
the fact that I was trying to run 4 systems and was not doing as
good a job of manual tuning and tracking of the OSCAR array.

Third. Notice how high gain antennas are a liability (if the signal is
strong enough to hear on an OMNI). Becuase they MUST be tracked or will
miss data.

PASS-TWO: On the next pass (Only 17 degrees to the west over western
USA), Murphy's law ruled. A bureaucrat came into the lab and wanted to
re-boot all PC's to find out their licenses. By the time that was over,
the pass was well in progress. The HT was not outside. It takes 3
minutes round trip to get the HT outside on the west side of the building
and so the OSCAR station was not tracking or tuning. The MOBILE was still
parked on the east side of the building! Etc.. We did see 49 packets
including N5ZNL, W5ACM, WB3ANQ, KE4SLC.

CONCLUSION!

1) Message delivery TO a stock 9600 baud HT with rubber duck works well
and demonstrates a GREAT steap forward in Amateur Satellite
Communications.

2) High gain antennas are a liability. Their only advantage is for
elevation angles below about 10 degrees, but require roof mounting to see
the horizon etc... (Fixed station communications is not the objective
here.)

3) The 20" (3/4 wave receive and 1/4 wave XMT) whip over a ground plane
still seems to be an ideal MOBILE or FIxed station antenna. For SUNSAT it
will receive all data when the satellite is above about 10 degrees.

LESSONS:

* The mobile 2m 5/8 wave whip on a mostly plastic VAN roof does poorly on
435 MHz receive!

* The "unatteneded" Mobile D700 without a PC, can either SEND messages or

RECEIVE, but not both. If receiver is on satellite frequency, then DCD never clears to allow transmit. Or if you QSY to allow transmit, you wont receive. The fix is either to MAN the radio to do very brief 1 sec QSY's every minute or so to let it transmit, or to use a LAPTOP (FULL DUPLEX works in TNC PACKET mode).

* Since the Kenwood HT and Mobile only have a 16 deep MESSAGE memory, these operators will either need to read quickly, or make choices. THey can choose to WILDCARD messages and thus see all traffic to/from everyone. Or choose smaller MESSAGE GROUPS. In either case, BULLETINS should be minimized since all stations will capture these.

* OR BULLETINS should be sent to BULLETIN GROUPS. THis way the radio can filter out by BULLETIN also. THus the user can ignore the SUNSAT bulletins, or look for only BLN#AMSAT bulletins, etc...

RECOMMENDATIONS:

1) Rather than 66 samples every 10 seconds of telemetry that is changing very little, a more complex algorithm could cycle through a whole orbit of samples taken at 3 minute intervals. If the time of sample #1 could be associated with the ascending node, then we would see samples 1 through 30 representing a whole orbit. During a 10 minute pass, we wouild see each telemetry value twice, thus improving our probability of receipt greatly. The result would be that everyone would see a whole orbit cycle of telemetry.

2) I told you that the format for bulletins was "BLN#_____". But that was using the underscore as a place-holder. Those 5 spaces should be the ASCII SPACE character if the bulletin is to be a general bulletin to all stations. With the underscore, it implies a Bulletin to the BULLLETIN GROUP of "_____". It will be better to choose a BULLETIN GROUP (5 chars max) for the SUNSAT BULLETINS so that in the future, stations can be selective about what they want their radio to capture...

Maybe "BLN#SO-35"...

THANKS FOR THE TEST!

de WB4APR, Bob

CAVEAT: (Existing THD7's need a PC to work packet at 9600 baud, since internally in APRS mode, it goes to 1200 baud. ALso it cannot operate crossband with the TNC, so it can either SEND or RECEIVE but not both. NOTICE the operative word here is "existing"...

IF (when?) a new model becomes available, then shirt pocket two-way satellite communications for amateur radio will be a reality!

END OF NON-PUBLIC TEST results.

Can anyone tell me if it is possible
to switch the TNC on the D7 from 1200 to 9600b
and vice-versa from the keypad.

I'm trying to get mine to decode APRS at 9600b,
and 1200b when in the field without a PC available.

The same day Bob Bruninga said :
No. Not today anyway... :-)

----

if you want to run APRS with a computer in 9600 baud mode then
you just need to add hbaud 9600 to the TNC setup list in the APRS program
and put the d7a in packet mode not APRS mode.

The site is http://www.trgnet.com ... not very logical, and took me some
searching to find it.

The product you are looking for is the SuperPilot II XL. It upgrades the
PalmIII to 8Meg of RAM and 2Meg of FlashRAM. From what I understand, the
2Meg FlashRAM can be used for storage, but you have to move the application
out into the 8Meg area to actually use it ... sort of like off-line
storage. They include software to do this.

I'm planning on ordering one of these just as soon as my IRS check comes ...
one map for APRS is crazy, so the 8Meg should allow me to load all the ones
for the area.

Who is TRG? This may be a very DUMB question but I can't figure out the
answer. I tried the obvious www.trg.com and got a site ethat has yet to be
setup.

Thanks in advance Paul, James (VE7JMS)

On Thu, 6 Apr 2000 PETEAMAR@aol.com wrote:

> I thought the KW TH-D7A only operated APRS mode at 1200 baud.
> I don't see any options for changing baud rate in the menu.

True. I'm having to be careful about what I say... <grin>. The "current"
THD7 is as you describe. But if you hook a laptop up to it, then just send
it the command HB 9600 and operate APRS that way. If you look closely at
my writing's on this subject, I try to always make the distinction between
the "current" THD7 and the "future potential" for shirt pocket amateur
satellite text messaging...

I think this will all become very clear in the near future...

If you konw what I mean...

:I'm looking for opinions.
:
:I'm at a fork in the road, deciding whether to go to the Windows CE camp or
:the Palm camp. I want a handheld device to use primarily for 1.) mobile
:APRS use and 2.) e-mail processing via modem. With the recent introduction
:of APRS/CE and of color Palms, it looks like I can go either direction.
:
:Anyone have any personnal experience or recommendations?

Disclaimer: Since I am responsible (for better or worse) for APRS/CE - I'm always on the lookout for CE bargains... if you're not, hit delete.

I found what I believe to be a bargain. CompUSA has the Compaq Aero 1520 for $199! I saw the same unit in Staples a week ago for $299.

Some highlights:

16-Megs - plenty of room for APRS/CE and pocketAPRS or Win/MacAPRS maps, tons of room for dosAPRS maps.

Excellent LCD, best grayscale I've seen - reminds me of the Palm V or the newer III's - the backlighting causes the screen to look "reverse", so the built-in software has an option to reverse the screen (so it looks normal) when the backlight comes on. Screen resolution is the standard PSPC size of 240x320. Nice anti-glare coating - some of the other PSPC's I've owned could easily double as nice shaving mirrors. :-)

Battery life is great so far - on its first charge it lasted for 8 hours with an active Ethernet connection (CF 'net card). It still has about 50% charge left! (I know, Palm users are snickering, but this is pretty good considering what's "under the hood".) BTW, you can buy an extra battery and switch them out in about 5 seconds.

It's *thin* (7/16" or about 1cm) and light - about the size of a Palm III.

You can buy a cigarette-lighter adapter from Compaq for it. You can also buy a short (1 foot) cord that plugs into unit's serial port and ends in a DB-9M, so you don't have to hassle with two long cords and/or gender-benders. (Don't know how much these items cost yet.)

It's non-APRS related, but it's got a headphone jack and can play MP3's. (Haven't played with that yet, I've only had it about 24 hours.) It comes with a full copy of Outlook 2000, not Outlook Express, and ActiveSync 3.0.

Finally, yes, APRS/CE loaded and ran just fine. Performance is a bit below my color E-100, but not annoyingly so. (133MHz vs. 70MHz - $399 vs. $199 - you choose. ;-)

No, I don't work for Compaq... I just think it's a good deal, especially if you're looking for a platform on which to run APRS/CE. It seems that, finally - perhaps before it's too late - the CE device manufacturers are figuring out that there are more people willing to shell out $199 for a good, not-too-stripped-down PDA than there are people willing to shell out $599 for the latest and greatest color superwhizbang PDA. I have both, but it's not a difficult task to guess which one will be accompanying me day-to-day.

Winks and nudges are generally considered to be violations of NDA's. ;-)

Well, on that topic, I'd like to volunteer some features that a D7A-II would be very blessed to have.

1) Much more configurable. Lots of functions the D7A performs I don't have a choice about. I'd like to be able to selectively turn the following on or off:

-Full screen display of new APRS data (ON/OFF) This would get rid of the keystroke robbing APRS posits.
-Beep on Mine (ON/OFF)
-Beep on Message (ON/OFF)
-Beep on Other (ON/OFF)
-Beep on Duplicate (ON/OFF)
-Beep on Key (ON/OFF)
-APRS baud (1200/9600)
-APRS while PACKET (ON/OFF) Is there a reason why the TNC can't do both at the same time?
-Posit default to Last NMEA Posit (ON/OFF) Battery goes dead while off the GPS -> posit is lost. Happens to me every day. It's annoying to have to remember to ALWAYS press POS, OK, OK before leaving the car.

3) APRS full duplex.

4) APRS cross band.

5) KISS mode transmit

6) Put the characters in the right order when using alpha entry. (abc2ABC, not ABCabc2) Entering numerals is a pain, and for me the most common characters are numeric.

7) Support for a wholly new APRS format: Repeater Posit. Include Lat, Lon, Frequency, Offset, Tone, PHG etc. Include features to allow a repeater to be tuned automatically by selecting its posit from the list. Also include a "repeater search" feature that tries to tune in posit-tx'ing repeaters based on distance and PHG. Anyone whose visited WA5IHL's wonderful New-Mexico mega-link can tell you... this would be a big benefit. (Those repeaters all appear to have adjacent APRS digi's, which give posits)

8) Support for weather stations through the PC serial port.

Actually, I recall now, that it's worse than this:

Get out of car: POS, OK, OK, MENU, 2, 2, UP, OK. (Hope a new APRS packet doesn't come in and steal your keystrokes)
Get into car: MENU, 2, 2, UP, OK. (Hope a new APRS packet doesn't steal your keystrokes)

My girlfriend always gives me this look whenever I pop open the center console and poke 8 (or possibly much worse, if APRS data is coming in) keystrokes before I can shut the engine down. I feel like a fool doing it.

How about updating the position display while not in APRS mode? The D700
doesn't even let you get to the position screen unless you are in APRS mode.
The D7 lets you get to the screen, but it doesn't update. Since my tripmate
has no display, this is very inconvenient!

It would be nice if both radios sent the APRS packets out to the PC serial
port for logging and displaying when in APRS mode. Neither do this.

You know, while I'm complaining, it would be nice to be able to pick between
abc2ABC and 2abcABC from the menu.

My most common status text or APRS message is of the form: "MON 146.97"

With the current setup, this simple message is 46 keystrokes.
With abc2ABC, "mon 146.97" would be 31 keystrokes.
With 2abcABC, "mon 146.97" would be only 19 keystrokes.

That difference is HUGE.

anyway, new idea
9) Optional automatic status text generation. Allow transmission of current
"other band" tuning settings as status text. This would allow people to find
which repeater you are on. "Mon 146.970-, tone 100.0" would be a huge help in
making voice contacts.

53. [htaprs] APRStk Time Zone Setting

From: "Fred Hatfield" <hatfield@bellsouth.net>
Date: Fri, 7 Apr 2000 17:28:30
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76037-2000.04.07-17.28.54--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am a newbie still exploring APRStk. So far, I have found
a few niggling problems that I have managed to overcome by
intensive reading of help files, experimentation or just plain
serendipity.

There are a few that I would like to see if anyone has any
suggestions. I am using a D700 and version 10 of APRStk.

One of my problems is using the P-List Satellite entries to
determine when the next pass is coming up by the specified "W"
key. It works on the first try, but will not work again afterward.

The second problem was why I was not copying any sats. I finally
solved that one by downloading sat schedules from other web
sites and comparing them to the graphic indicator on the bottom
of the screen. They all appeared to be one hour off. Changing
the DST didn't make any difference, but when I did the ALT-S, Other,
Zone and changed it to EST, everything began to work. However,
I am in the Central zone and the timestamp shows everything as
an hour earlier than local time. The graphic indicators are
proper, however, and I have been copying some transmissions. Any

suggestions on this?

I have copied some transmissions as indicating "USAT5". Is this
an alias for one of the other sats in the P-List?

These seem to be the main 'niggles' at the moment....

And here is my 'new idea':
Provide the option of setting the D7's Position to the position of the
first digipeater it hears repeating its own signal. Or, I suppose the
digi's could be set to replace a null position with their own. This would
at least give an approximate location for everybody.

I had discussed this as a "follow me" feature, where the operator could
select any station in the list, and the D7 would update it's position from
the selected station. That way a D7 in a mobile goes with the mobile.

Hello again. The 2 meter transmit has again gone out in my D7A. 4th time
with 3 different rigs. Save your breath about poor antennas, coax, SMA
adapters. I made a special effort to monitor
SWR levels, power outputs, heat build ups, and the current phase of the moon
and outer planets, and it still died. It Doesn't seem to be able to handle
transmitting in a vehicle every minute, for more than 10 hours a day, four
days a week. This is my work schedule, and the rig again failed, in about
the same amount of time at this duty cycle.

I guess I'm being paid back for the last 25 years of having no major
problems with any gear that I have bought.

On Fri, 7 Apr 2000, Christopher McNabb had a ... 'new idea':

> Provide the option of setting the D7's Position to the position of the
> first digipeater it hears repeating its own signal. Or, I suppose the
> digi's could be set to replace a null position with their own. This would
> at least give an approximate location for everybody.

This is built into APRSdos.
If anyone transmits a packet without a position or with a 0000/0000
position, then APRSdos will automatically place you on the map within a
mile of the nearest digpeater. Your ICON will be a biq QUESTION mark,
indicating that it is a "vicinity" plot.

Thus, people at least know what area you are in and what path to use to
reach you. This only works if your first HOP in your PATH is RELAY, or
WIDE, or TRACE. It does not work if you only use WIDEn-N.

That is why we suggest a path of XXXX,WIDEn-N in the WIDEn-N areas where
XXXX is one of the three generic paths above..

de WB4APR

For your info, APRSdos will also allow any THD7 user to indicate position
ambiguity of one mile too. If you enter your manual position with .00/.00
for the decimal portion of your LAT/LONG then APRSdos will plot you at
that location but mark you with a 1 mile ambiguity circle...

This is a great way to indicate your approximate position in the
area of WORK, or SCHOOL, or HOME, or a HAMFEST, etc without having
to carry around a GPS all day...

The D700 has Position Abiguity built in, so this .00/.00 trick is only
needed in the THD7...

Dave Van Horn discussed this as a "follow me" feature, where the operator
> could select any station in the list, and the D7 would update it's
> position from the selected station. That way a D7 in a mobile goes with
> the mobile.

Its in there! APRSdos will plot you that way if you just make the first
hop in the D7's path be RELAY, and set GPS-NMEA ON (but with no GPS
connected). This way, all APRSdos stations will plot you in the vicinity
of your CAR, your HOUSE, or your WORK, or wherever your D7 finds a
RELAY... without having to lug around a GPS everywhere...

By setting the D7 to GPS-NMEA on without a GPS, then it transmits a
000/000 posit which APRSdos will then try to vicinity plot. OH, this only
works if your CAR, HOME or other RELAY digipeater is a D700, or KPC-3 or
Paccomm TNC with callsign substitution...

If not, then you must enter the actual CALL of the station you want to be
plotted in the "vicinity of" as the first hop in y our path.

> an alias for one of the other sats in the P-List?

That is the PACKET call for UO22. All of the satellites have a packet
call that is different from their name.... except SUNSAT...

Thanks for the feedback...

 OK ... what did _I_ miss? According to some APRS mail I got from a "KC0"
call my MIR object was making it through the Montreal IGate. How do I make
it a "LOCAL" object???

 No talkie really is made to do this. A talkie is a man portable item,
carried upon the well shock absorbed human chassis. Man gets overheated
quicker than talkie so it generally doesn't break in that kind of service.
My D7 did not fail but it sure got beat up when I was doing what you are
doing and it would occasionally act strangely.

Now that I have the D700 and my D7 sits on my desk at at school or my belt
working much of the day on receive and some transmission on EL power to the
D700 digi-ing in the parking lot, IT IS A VASTLY HAPPIER CAMPER!

  The only ham talkie I have seen that could really take a beating was the
Icom IC2AT/3AT/4AT series and they seem to have a tendency to go deaf over
time.

65. [htaprs] SMA to mini UHF

From: "BobD" <BobD@virtualconst.com>
Date: Sat, 8 Apr 2000 15:49:03 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76180-2000.04.08-14.41.37--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Anyone know a source for a connector/adapter to go from the D7's SMA to mini UHF Female? I got rid of my little mag mount antenna that I was using with the D7 and installed a Comet mount that has a mini UHF on the end of the cable and a mini UHF to PL-259 adapter. I'd like to dump the PL-259 and go straight to SMA (or BNC at least).

66. [htaprs] DX Lists in Kenwood radios

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 8 Apr 2000 15:45:22 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76183-2000.04.08-14.47.37--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Many of you may not have used your kenwood on a DX cluster frequency. But if you do tune one in, you will see DX spots on the radio's DX LIST. APRSdos has had the capability of posting items to these lists as well. For that purpose, I call the format an APRS RESOURCE. And I defined the fields sort of based on the way they are displayed on the THD7 and D700 as follows:

```
       +--------------+     +---------------+
       | Dx:RESOURCE  |     | Dx:RESOUIRCE  |
       | FIELD-ONE    |     |    FIELD-TWO  |
       |       FORTH  |     |    FIELD-3333 |
       +--------------+     +---------------+
```

And on the D700 as:

```
                            +----------------------------+
                            | 1:RESOURCE           FORTH |
                            |             FIELD-ONE      |
                            |   FIELD-TWO FIELD          |
                            |   -3333                    |
                            +----------------------------+
```

Currently, the only use I have found for this LIST in the radios is for sending SATELLITE schedules to the mobile THD7 and D700. These appear as:

```
       +--------------+     +---------------+
       | Dx:UO22@1435 |     | Dx:UO22@1435  |
       | UO14@1443    |     |    KO25@1455  |
       |              |     |    SO35@1510  |
       +--------------+     +---------------+
```

And on the D700 as:

```
                            +----------------------------+
                            | 1:UO22@1435                |
                            |             UO14@1443      |
                            |   KO25@1455 SO35@          |
                            |   1510                     |
                            +----------------------------+
```

Thus, you will receive an alert for up to 4 satellites using this format. ALso note that these DX-CLUSTER memories in the D7 and D700 are volitile and so are cleared whenever the radio is turned off. I do the same in APRSdos. DX spots and APRS RESOURCES are temporal. They are posted when

they are needed and are not assumed to be retained...

So, if someone in yoru area is using APRStk to post the workable FM
satellites in your area, then check out your radio's DX list for a
schedule of when to expect them...

67. [htaprs] APRStk ver K11

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 8 Apr 2000 16:20:25 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76190-2000.04.08-15.21.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This K11 version of APRStk fixes three things that impacts the
transmission of Satellites as OBJECTS to other users of the THD7 and D700:

  1) It fixes the alt-SETUP-OTHER-DST so that it works for Daylight
      Savings time. The workaround was to change your time zone by -1.
      Now you can leave your time zone the same and just toggle on and off
      the DST twice a year.

  2) It fixes the P-LIST-WHEN command so that it works more than once.

  3) It changes the KILLed object timing for satellits below the horizon
      so that these are transmitted much less frequently when out of view.

Thanks for the bug reports. This is posted as a new astk-exe.zip as
follows:

    ftp://tapr.org/aprssig/dosstuff/APRSdos/astk-exe.zip

It contains all the support files needed to make it run within your
existing APRSdos environment. I will NOT have time to update the full
stand-alone 1.2 MEG APRStk.ZIP file today. Kids birthday... But all you
need is in the astk-exe.zip if you already use APRSdos... And of course
it always includes the latest KEPS...

68. [htaprs] Citadel Computer Online in APRSTk - Now!

From: "Brian B. Riley" <brianbr@wulfden.org>
Date: Sat, 08 Apr 2000 18:11:34 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76206-2000.04.08-17.12.05--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I took the computer from Scott that had the cracked screen awaiting
replacement and used INTERLN/INTERSVR to put Laplink3 and Iomega Guest onto
the 486/25. I then used combos of LapLink and my Parallel Port Zip Drive
other stuff to move the APRS846 off and APRSTk vK10 on, It is up and running
and noticeably faster than the old 386sx/20MHz was ... Been up and running
for couple of hours and looks good save for the damaged screen. The screen
redraws are a whole lot faster!!!!!!

The closest thing I have to a complaint is that there are very few 'shades'
of electro-yellow, so some of Bob's hilighting is lost so some things in
APRSTk don't show up so well. I am gonna make another ZipLan connector
tonite so I will be able to see stuff on another computer.

Later I will be putting APRSTCH on the 486/50 and see how that runs.

Funny, the FlashROM on the 486/25 appears to be 3 MB not 2 MB.

At the risk of repeating myself ... great work! Scott; These computers are
wonderful! Who said DOS was dead???? (says the diehard Mac-head! <grin>)

I have a ndw APRStch ready to go that adds the MAPS-PLOTS and MAP-OVERLAY
menus as well as the OPS-REPLAY and other functions.  But I need to know
what is the MAPS-FEATURES-LABELS color that ggives the best "mid-tone"
color to the labels so that they show up at half brilliance, and I will
set that to the new default.  I left my CITADEL a the office, so I dont
have one here to test.  So you tell me what color 0-7 works.

In a mature network this leaves it open for people to transmit their
position (or at least their operational status) without having to fuss
with GPSs and PCs - a TNC into a very low power TX would do it.

That is quite punishing when you think about it - the heat/cold effect of
several watts being pulsed. But it is disappointing I agree.

I have just purchase a D700 and love it. I have a questions I need help
with. I thought the D700 would take its time from the Garmin III system
when connected. It appears that I do not have something set correctly.
How can I get my D700 to take the time from Garmin III.

Thank you in advance.

I have just purchase a D700 and love it. I have a question regarding
mute.
I have APRS on the A side and 2 meters on the B side. When I try to mute
the A side (highlight the B side and press mute) as in the Kenwood manual,
it does not mute. I have to turn the volume down. What am I doing
incorrectly.

Thank you in advance.

Check out this link to MicroWarehouse:

http://www2.warehouse.com/product.asp?dept%5Fid=3890&pf%5Fid=PDA1035&cat=micro

They are advertising them at $199.00.

You also might want look into the "travel pack" option. It is supposed to come
with a cigarette lighter power cord and extra serial cable.

Let me know how it works if you choose to get one.

Thanks,

Joe Leitsch, K4DMU (joe@iglou.com)

Hi Joe and everyone else

I recently bought a aero 1520 from Radio Shack they have to special order it
but the price is $199 as well. It didn't come with
car charger however. I am really happy with it I downloaded the winCE aprs
and it it runs really well but I don't have the cable
yet to hook it to my D7. I will probably order one from compaq next week.

Regards

Gary

I am sure this is a mute point, but I will say it anyway.

Have you done a total reset of the microprocessor.

My radio hangs up on occasion but so far doing a complete reset has always
brought it back to life. Sometimes I even get away with just removing the
battery, waiting a few seconds and then reinstalling the battery.

Yes, it isn't right and yes, it is an inconvenience, however as long as I
can bring it back to life and it operates normally, I am satisfied. From my
limited knowledge of microprocessors, hang ups are the nature of the beast.

Just my two cents worth,

Herb
KB7UVC

I have Citadel PC working but it and the D7A HT do not talk to each other.
I've gone over the books on working the D7A with laptops and thought I had
everything setup OK but I guess not. Could someone give me a quick checklist
of settings which need to be. I'm stumped. I'm using COM1 and set at 1200
baud....cabling is OK. don n2zwo

Hi

I wonder is there any one on this list using ui-view. I have a few stations running Ui-View here in South Africa. The prob I am having is the following.

The d7/d700 can be seen on the base stations running Ui-View but the base stations can not be seen on the mobile or handheld rig's. But you can send a msg from the pc to the rig and visa versa. All the stations can see each other but the mobiles just can not see the ui-view station's for some reason.

Many thanks

Peter

85. [htaprs] Citadel TOUCH SCREEN APRS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 10 Apr 2000 11:06:17 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: APRS <aprssig@lists.tapr.org>,
        Scott-KC5JGV <kc5jgv@bobcats2.oursc.k12.ar.us>
Message-ID: <LYR845-76570-2000.04.10-10.07.14--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just posted a new APRStch.ZIP which adds a few more menus to the Touch
Screen and also allows for more stations, up to 150 or so. Here are the
two new menus:

MAPS-OVERLAYS:

   DIGIS, GATES, NWS stations, NWS Radio stations, Radio SHacks, HAM
   stores, ZIP codes, Past CAP wrecks, etc

MAPS-PLOTS:

   Map Borders, CAP Grids, DF data, Grid Squares, Power-Height-Gain,
   Range RIngs, Traffic QSO's, etc

Also, I changed the default LABELS color to 2. If you have already saved
your config file then you need to change MAPS-FEATURES-LABELS to 2 and
re-save.

I made more room for up to 150 stations and left out 3D Maps, NTS Traffic,
Ethernet interface and MODEM Dial up.

What are we going to call these things? CITADEL?

ALSO, there are HUNDREDS of old PEN-SCREEN 386 Grid computers out there
that have the same size screen but are only HALF as thick. It uses the
screen PEN just like a touch screen and it works just like a MOUSE in
Win3.1. But the mouse drivers did not WORK when running dos. I never
persued it further. Now that I have done the work in APRStch, its time to
look at this again..

Im sure all it takes is the right driver and someone who understands how
to configure drivers to get that PC also working for APRStch! If anyone
has one of these or konws how to get a pen driver to work just like a
MOUSE in DOS, then we get another one to play with.

86. [htaprs] d700 and winpack

From: "Peter ZR5DWC" <zr5dwc@iafrica.com>
Date: Mon, 10 Apr 2000 17:22:46 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76587-2000.04.10-11.01.06--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All

Yes I have just got myself a TM-D700. Wow what a rig. I am having some problems with winPack and the
rig. I can not send more than 50k in yap mode and when I send smaller files via YAPP it aborts the YAPP
process. And I get various errors (""Cancel" was send via the other staion") is one of them. I know
abort was not sent as I did not send it nor did the other staion as I am the other staion as well. After
 it has done this I get the following : cmd:?link out of range Any idea to what may be wrong.

Many thanks

Peter
ZR5DWC

87. [htaprs] Compaq 1520

Rendered body type: text/plain

Some one on the list put up a msg about having a 1520. Could that person contact me directly about the
unit as I wish to get one. I just wish to find out your views on the unit. Is it easy to use and have
you tried it out on Packet aswell.

Many thanks

Peter

When sending messages from UI-View, make sure you are using APRS format.
You cam make it the default by checking "Default message type APRS" in
the "APRS Compatibility" set-up dialogue.

> of range Any idea to what may be wrong.

Does the TM-D700 support transparent mode? I.e. does it have a
TRANSPARENT command? Yapp is a binary mode, and the TNC has to be able
to accept binary data without being confused by it or altering it in any
way, so transparent mode is used. It also has to be able to support
hardware handshaking. You can't use XON/XOFF with binary data.

Check those points, and make sure the basic, important TNC parameters,
as specified in the "Setting Up The TNC" section of the WinPack help are
supported by the D700 and are set correctly.

Also, with the TH-D7, there was a problem with the input buffer of the
TNC getting overrun if you used it with Win95/8 and a UART with the tx
FIFO enabled. The solution was to switch off the tx FIFO in Device
Manager.

(Remember that in the main market for these rigs, they are being used
mainly for APRS, and so their functionality when used for mailbox access
and other "normal" packet activities probably hasn't been well tested.)

A final point - there is a mailing list for WinPack support, where you
may well find other WinPack users who have a D700. You can subscribe to
it by sending an email to winpack-subscribe@egroups.com, or going to
http://www.egroups.com/subscribe/winpack.

91. [htaprs] MIR on Packet?

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 11 Apr 2000 12:00:09 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76779-2000.04.11-11.01.38--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A station in Australia reports hearing packets on the MIR downlink.
Keep in mind that this could be an erroneouse report (ie: someone
else trying to *transmit* to MIR, instead of MIR iteself..)...

I heard nothing on the just completed 1130 EDT pass over the East coast..

But when/if MIR packet becomes operational again, remember, it can be used
for THD7 to THD7 packet messaging with only whip antennas. The question
will be whether this mode will be "encouraged", "not mentioned", or
"banned".

Unless such operation is "banned" then it could be argued that such use
is only 5w ERP compared to the BBS operators who will typically use 100w
into a 13 dB gain antennna for a net ERP of over 2000 watts ERP.
Therefore a few HT-to-HT packets at this low level will not interfere
with the BBS operation.

Subject: APRS

The balloon launch is a week from this Saturday! I have no help at this
point. We need to track and recover the balloon. This does not have to
be
a fox hunt. The GPS will be transmitting at 146.565. This is an APRS

application. Could you shake the trees to see if you know anyone who
would
be willing to help?

Info: Saturday April 15.
Starting time: 7:00am
Starting place: Allendale High School
Coffee, rolls and gas money will be provided.
Each person has to be willing to take a High School student with them so
that they can learn!

If you know any takers, Have them contact me at bbreth@altelco.net or
616 895-6961

96. [htaprs] Alinco DR-135 for APRS?

From: "Jim Gill" <gillj@uswest.net>
Date: Wed, 12 Apr 2000 01:52:19 -0500
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76905-2000.04.12-01.57.52--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

On page 55 of the spring/summer 2000 AES catalog, Alinco is advertising a
DR-135 2m mobile, with "optional internal packet module [that] can be used
with APRS". The typical type-acceptance-not-received-yet disclaimer appears
for this radio (not unlike the Icom IC-R3 "video" wideband receiver, but
that's another topic altogether). Nothing like getting people frothing at
the mouth ahead of a product release (worked on me, apparently ;^])

The ad also states it has "front panel data input", "9600 packet mode", and
"rear panel serial port connection".

Anyone know anything about this alleged forthcoming DR-135? Nothing on
Alinco's website about it.

Thanks in advance...

97. [htaprs] D7A goes deaf (revisited)

From: Brian Badger <Brian.Badger@wcom.com>
Date: Wed, 12 Apr 2000 09:13:47 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-76960-2000.04.12-10.14.22--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

All,

I've tried all of the recommended solutions, but the problem
remains: whenever I hook a serial cable up to the "PC" jack on my D7A, it
goes completely deaf.

What I've tried:
1) Shielded DB9
2) Data lines wound through ferrite cores
3) The entire cable wound through a ferrite core
4) Running the computer on battery

Nothing seems to work. It's definitely caused by the cable, as when I
remove the jack, APRS traffic immediately causes it to break squelch, with
the jack plugged in: nothing ever breaks squelch. With the squelch open
and the jack in, all I get is open channel noise. Is there any kind of
floating ground issue with certain PCs?

99. [htaprs] SUNSAT Test Continues

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 12 Apr 2000 13:20:33 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-76982-2000.04.12-12.21.09--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For those of you with 9600 baud TNC's or the Kenwood D700 mobile radio,
there will be several days of an UN-ANNOUNCED APRS digipeting via SUNSAT
starting tomorrow (APril 13th). Possibly culminating in an announcement
next week.

THis is to work out the bugs. Please do not announce this beyond this
list. It may not work. It may not be on. But if you want to try to
digipeat via satellite, come join us.

9600 baud Uplink is 145.825 and donwlink is 436.250 +/- 10 KHz doppler.
DIGI callsign will be either SUNSAT or APRSSAT.

For tips on setting up your TMD700, refer near the bottom of:

   http://web.usna.navy.mil/~bruninga/astars.html

P.S. If you are a real satellite OP, they would really appreciate raw
KISS Capture files. These are typically logged by WISP. I dont think
that Hyperterm or Procomm can do this 8 bit binary capture. If someone
will identify an 8 bit capture program and inform us all???

I stress again. That there are political needs to let any public
announcement of this capability to follow the proper channels. We are
being alerted only to make sure that it works for us first. But it is to
our best interest to keep it low key and "mum's the word...

Remember to set FULL DUP ON (with your PC) if you want to both send and
recive from your mobile.

Thanks, Bob

Message-ID: <LYR845-77020-2000.04.12-15.34.16--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi

I have just run a ramtest on my D700 and I got the following:

```
cmd:RAMTEST
RAMTEST
RAM Reset!!
ERROR ADDRESS 000def0f
RAM Check
  32KBytes OK
  64KBytes OK
  96KBytes OK
 128KBytes OK
```

Is this normal? It is the error address that worries me.

Any info any one?

Thanks

Peter

Rendered body type: text/plain

Hi:

I have the Palm IIIx travel cable and would like to wire it to my TH-d7.

After I cut the db-9 off the palm cable, which wire is what?

I looked all through my palm info and can't seem to find any such info.

Thanks for your help.

Rendered body type: text/plain

i found out last year that if i have my thd-7 in aprs mode, and run a
remote headset mic, the units receiver on aprs starts to make a pulseing
noise , when it does this the radio thinks there is a signal on freq. and
wont beacon out.

        my guess is the cable is acting as an antenna and picking up rf
from the receiver, and generating a signal back onto itself.

i also noticed if i plug in my serial port cable , that if i coil up the
cable at any point it will pulse, if i make the cable straight and put the
radio in a metal trashcan it works good.

           i have had several hams say my signal sounds like trash, of
course they don't know my radio is in a trash can.

         .ha ha

find me on a map!   go to   http://map.aprs.net/kd8s-7

Rendered body type: text/plain

Hello all,

I am currently putting together plans for a project that has been evolving in the back of my mind for the past several months. Basically, I want to integrate a PC into my vehicle so that I can more easily tie together my TH-D7A, GPS, and packet operations as well as other stuff that I have in mind for the future. I can even envision integrating it into the entertainment system of my vehicle for instance.

Anyway, I am stuck on one key piece of the project. That is the monitor. I intend to use an older laptop computer for starters but I don't want the bulk of the laptop monitor. What I would like to get is a small (say, six inches or so) LCD display that could be linked to the laptop and act as a normal PC screen. Obviously, I don't want to spend much so price is critical. Anyone have any ideas where such a screen can be obtained as surplus or some other cheap means?

Oh, by the way, my vehicle is a full-sized GMC conversion van so size is not as critical as if I were driving a Saturn or Honda. This first attempt will be a prototype and maybe refine it in a smaller package down the road.

I think they screwed up the times again. NOtice the 2.5 hour separation between the 01:36 and the 04:44 pass, instead of 1.5 hours.. It aint over north america at that time...

Or, Im all screwed up.... By the way, nothing heard on the 01:36 pass.

The Kenwood radios are a poor choice to use for packet recovery tests. I
have stated several times and will continue to state that the TNCs in the
Kenwood radios are much poorer at decoding packets than units from Paccom or
Kantronics.

Hi David,

I have thought about this for a short time myself. Personaly, I think the
way to go is a laptop or low profile desktop pc with a $700-800 15" USB LCD
monitor. But here are some other ideas I had. You might be swayed if you are
into SSTV.

If you have a GMC van conversion, you aren't suffering for space. If you had
an extra desktop PC around the house, a DC to AC converter that could power
the computer, a video card that had a "NTSC" video out (many of them do
these days), and purchased a 4" color monitor. (These can be purchased as an
accessory for a video camera). This could be cheaper than the 800 LCD USB
monitor, but your eyes might hate you for it.

Another option is to buy the above equip but use an ICOM mobile radio with
the video input instead of the video monitor. (heres a link
http://www.icomamerica.com/amateur/dualmobile/#IC-2800H) This still would
not be as pleasing as a laptop or USB LCD display. By the way, things are
hard to read and look at when you take 15 inches down to 4 or 6 inches, so
before you get too deep... consider the consequences. If you found programs
that could compensate for this (extra large fonts, etc) you might be ok. But
then that 15" would give you over 4 times the viewing area of a 6".

Hope this helps,

Walter

FYI -

I heard one station, and received one message on my D700A on the 4:44
pass. I heard both packets at 21:54 local time (PDT, -0700).

The one station was KE6ZC-8, 310 miles, 135 degrees away from my car in
Silicon Valley.

The message I received said, "High resolution image broadcast active."

ANY Consumer grade lcd display will not work in a vehicle. It will totally
wash out during the day, and most do not have enough brightness control for
night operation. Also the extreme heat in a closed vehicle will destroy it
quickly. The only way to have a decent monitor for a vehicle is to purchase
a commercial product designed for mobile vehicle use. Yes, they are
expensive. This is from experience trying to put mobile data terminals into

police cruisers at my work.

I agree with you for almost ALL of the signals you hear on the air that
are improperly set up. But I do not agree with you for a properly
adjusted transmit signal. 95% of the signals on the air are terrible.
What we need is a good test with a known good signal...

Like you, I would love to see a well engineered and performed
test with signal generators and attenuators to get the real answer.
My THD7 will not decode some packet signals on the air that sound like
mush that light all the Smeter segments. But then it will decode very
weak signals perfectly that are properly setup for deviation, and tone
balance.

It will also decode 9600 baud signals so weak that NONE of the Smeter
segments are lit.

Agreed... with some exceptions...
Thats why I love my old Zenith 8088 and 286 laptops. Their displays are
very old LCD displays (CGA) not grayscale VGA, and so they look great in
direct sunlight and have complete backlight control at night. Mine
remains in my VAN at all times and has been there since about 1994.

We also use 5 of them on Naval Academy off-shore 40' sailboats where they
get splashed on, get hot and get cold and just keep on truckin. We are
now in or 7th year with the same old clunkers... They only draw 250ma
too. RUnning with APRSdos from a floppy, they never access the drives
during normal operation unless a new map is needed.

Im not arguing your point. Just offering a couter example..

P.S. I buy these things at Hamfests. I used to pay up to $50. Now I
wont pay more than $10 for a 286 or $5 for the 8088's..

Also, the display is a large 10.5" which is amazing for its vintage..

Almost all operators need to be reminded that so much
problems they have in getting out with packet
transmissions can be solved by a simple deviation
adjustment. 3 KCS for packet tones is more than enough!
Some of the later receivers have a lot of trouble with
even 4 kcs, and majority of transceivers seem to be HOT

with mike gain as it is.. Try lowering the deviations
and watch the difference guys...

John,

I still think it's good to collect the information
using the Kenwood radio. Since most people will be using
this in the field. I own Paccom, Kantronics and a TH-D7.
Since I got the Kenwood, I almost never use the stand-alones
when mobile or in the field. Therefore, knowing how good
the HT works is practically better for most people on the go.

The D7 I own (early version) locked up again the other
morning with open squelch, and the only way gain
control over the unit was to drop the battery pack.
This was the problem prior to sending it back for the
mods Kenwood has been doing the past year. So I
called the repair center and spoke with Clifford who
suggested I try the filtered power cord as that has
helped certain problems in the past. This I did with
the help of another user who loaned me his Kenwood
power cord. To my surprise the unit worked flawlessly
this morning, however, I still have my fingers
crossed.
I had gone from a Garmin 295 with no problems to the
Pharos i180 gps that has a small power regulator chip
in the cigarette lighter plug. If this had anything
to do with it I'm not sure. It had worked with the
Garmin and no problems.
If others are still experiencing lockup how about
sharing your configuration and unit's mod history?
Clifford state they do watch this listing for our
problems and suggested often users find answers
quicker than the factory becomes aware.

Here is the schedule for tonight (thursday) and tomorrow Friday.
Over the USA...

14/4/2000 00:46z
14/4/2000 02:25z
14/4/2000 04:06z
14/4/2000 12:00z
14/4/2000 13:37z
14/4/2000 15:17z
14/4/2000 16:58z

I had no success so far although one packet was reported in Calif. These
passes were using a different UPLINK antenna, but downlink should have
been the same... THESE PASSES WILL RETURN TO 145.825 UPLINK on the
vertical ANT.

Bob

The S meter on my DH-7A does not act like a S meter. It is either full
on or full off , just like the green light.> It will be full scale with
an extremely weak signal just barley breaking the squelch.

One thing to check is the logic level used on the serial port of the
new GPS. The Garmins use RS-232 levels but some devices, like the new
Handspring PDAs, use TTL levels. I don't know if the D7 ports will
work reliably with TTL levels.

The regulator in the Pharos power cord should not be a factor.

I would not characterize 95% of the signals I've heard as terrible,
but I would like to second Bob's call for more testing with calibrated
test equipment.

A 0.1 microvolt signal is enough to break the squelch on my D7 on VHF,
which makes it the most sensitive VHF receiver I've ever owned. It may
be even better, since the signal generator was at its lower limit. The
transmit frequency on VHF is also right on, within the limits of the
tester. When Mir was still active, it was able to decode downlink
packets using the standard antenna for almost the entire pass, but I
wasn't able to see my own packet repeated until I switched to a 17"
whip.

The UHF sensitivity is less, which is to be expected, but the transmit
freqency is also off by as much as 1.5 KHz at the high end of the
band. I've been able to decode some 9600bps signals off packet network
stations, but haven't tried 9600 or digital UHF with weak signals yet.

One problem with on-the-air testing is that a misaligned receiver may
outperform one that is perfect if the transmitting station is also
misaligned. Another is that S-meters are a grossly inaccurate method
of comparing sensitivity between two receivers. And finally, a sample
size of one is not very significant, even if the radio is aligned
before testing.

What happens if the cable is plugged into the radio, but unplugged at the PC
end?

If you plug the cable into the PC and short together the TX and RX
connections on the radio end, does a terminal program correctly see
transmitted characters appear as received characters (ie: run a loopback
test on the cable)?

I have been running mine for almost a year and it works fine most of the
time. It blew up when I tried connecting it to a brick in a rented truck
with mag mount on the roof. I used the brick with my Icom 24AT just fine
but when I went to do my APRS thing with the TH-D7A it blew the finals,
the back got so hot I had to remove the battery, and a wire burned going
to the GPS. With all those clues you would think I had the problem down,
but I tried it with the same system after I got the D7A repaired and it
worked fine. Works fine since, but I don't use the brick, just a good
antenna to get/send a good signal.

Twice, I felt that my D7's were not transmitting. I wasn't making it into the
local repeater.

Both times I did the full reset, then reloaded the configuration via the MCP
software.
It appeared to work correctly and transmit after the reset/reload

As it happens, I've never tried this... but since another cable which connects my D7A to my Palm V does not cause the problem, I don't really think this is it. (Note: the Palm V is running off of battery, so the ground line is floating)

>

Oh, the serial cable works fine. I can control the TNC, with full TX and RX. The problem is not the serial connection, but the reception of radio signals.

Rendered body type: text/plain

This test will use a VHF downlink and should be many dB stronger than the typical UHF downlink and need no tuning. It may even work with a good rubber duck on the HT. The uplink now will propably require a beam and WILL require doppler tuning anticipating the Doppler at the satellite. This means start of transmitting 10 KHz LOW and moving to 10 KHz HIGH at the end of the pass (the opposite of what you do on the donwlink).

Here is what I got from South Africa:

The uplink will be 436.290 MHz (UHF monopole) and the downlink 145.825 MHz (VHF monopole). Unless indicated otherwise, digital services will be active at the following times over USA:

15/04/2000 00:17:00
15/04/2000 01:45:00
15/04/2000 03:24:00
15/04/2000 05:04:00
15/04/2000 06:44:00
15/04/2000 11:21:00
15/04/2000 12:57:00
15/04/2000 14:39:00 Voice repeater
15/04/2000 16:17:00

Hello all VK4JEN-9 is going aprs mobile for a business trip to the US
at 01 May for 2 weeks, I like track him here in Australia with the
program UI-View is there someone who can help with maps for Highway I-80

Reno Nevada, Saltlake-City, Denver Colorado all for UI-View only
please..
cheers all de Art

135. [htaprs] To anyone who was interested in the balloon launch on saturday the 15th

From: "jeff" <jeff@k8sn.org>
Date: Fri, 14 Apr 2000 18:12:57 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-77568-2000.04.14-17.13.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

To anyone who was interested in the balloon launch on saturday the 15th.
here is some more info. This is in Allendale Michigan near grand rapids..

Jeff

This is it people! I would like to right now thank everyone who has offered
to help. It has been a real blessing to me! Here is the lastest info!

Launch Time   April 15, 2000 Hopefully about 7:00 am

Place of Launch: Bosch Country View Nursery 10785 84th St (between Pierce
and Lake MI Dr. West side of road)

Mission Control 10769 68th   Allendale High School! (Go around to the
back of the school facing 64th. We will be near the loading docks)

Launch Simplex Frequency 146.52
Launch Traffic Repeqater Freq: 147.16

APRS or Packet Frequency: 146.565 This is a one channel homemade
transmitter.
ATV Frequency: 439.5 (We are using also a down converter, this ATV does
not have a lot of power.)

We need people to help track and help with mission control. I have never
done this before, so I can't be sure where the needs will be so if you come,
plan on being flexible. I would like you to interface as much as possible
with my High School Physics Students. There are 9 of them who are working
on this project!

Thank you ever so much

Brian Brethauer

136. [htaprs] TM-D700 Deviation

From: Greg Noneman <greg@clubnet.net>
Date: Fri, 14 Apr 2000 18:07:48 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-77579-2000.04.14-20.09.44--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Does anyone own a service manual for the D700?

I measured the fm deviation on both VHF and UHF and found both to be on
the high side. I would like to adjust the levels, but I opened-up the
radio and no trimpots were immediately obvious. If anyone has any info
on this, please let me know.

The values measured are as follows:

VHF voice : 4.2 kHz (1 kHz tone)
VHF packet: 3.6 kHz (1200 baud cal. square wave)

UHF Voice: 5.3 kHz (1 kHz tone)
UHF packet: 4.6 kHz (1200 baud cal. square wave)

As can be seen, all the levels are high (especially for packet).

Greg Noneman

137. [htaprs] SUNSAT WOrks!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 14 Apr 2000 23:52:51 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org, Robert Bruninga <bruninga@arctic.usna.edu>
Message-ID: <LYR845-77595-2000.04.14-22.53.41--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

* The first SUNSAT pass at 0014z I got nothing.
* Second pass at 0145z was STRONG on the 2m downlink. My mobile D700
  copied all 6 Bulletins and status. Saw no one else.
* Third pass at 0324 I operated Base station and got 8 BLNS digipeated and
  many other packets as fast as I could type them using HYPERTERM.

BULLETINS captured on my MOBILE from SUNSAT:

1) Please log all files in raw kiss format
2) Digipeating APRSAT callsign Active
3) APRS Server and UI data broadcast final tests
4) Contact address Lochner@ing.sun.ac.za
5) Please forwared binary files for assembly
6) High resolution image broadcast Active

LESSONS:

1) D700 radio BULLETIN groups allow only 4 bytes instead of 5. So SUNSAT
   should change to BLN#SO35 instead of BLN#SO-35. As it is, only SO-3
   is shown as the BULLETIN Group.

2) APRStk wont work with Mode B, since it defaults 2 meters to 1200 baud.
   I will fix, but is big re-write to account for uplink as well as
   downlink, and to now include Baudrate in each satellite entry.
   Thus, my unattended basestation got nothing.

3) Mode B Downlink on 2m is STRONG for delivery to HT with rubber duck,
   but requirement to uplink with pre-doppler in the blind without
   tracking program will be failure mode with the concept of PC-less
   users.

4) SUNSAT should buffer (delay) digipeat for at least ?250? ms? WIthout
   this, users of MOBILE or HT will never see their own packets and will
   thus be totally blind to their success. (Maybe you do, but we have
   not tried a digipeat yet from HT)

5) Other than the mobile, I screwed up with the HT's, handheld antenna,
   batteries, rubber duck, balance control, doppler tuning and just
   about everything else. So I got no real data here so far on the HT's.

BUT I can draw the following premature, and too-early-to-make
conclusion related to #2 above. For the concept of informal HT and
Mobile satellite message communications, there are many disadvantages
about this mode B:

1) Doppler tuning in the blind on uplink, will not work. Compared to mode
   J, where users UPLINK requires no tuning AND he can hear at all times
   the quality of the downlink and match doppler trivially. Yes, it CAN
   work for real-time voice digipeater where user "hears" his own uplink,
   but NOT for data where there is no feedback path to user.

2) For the conept of emergency communications from the USER, Mode J wins
   hands down. It has 9 dB better link from HT and it is NO TUNE
   required. Stranded motorist in wilderness just sets emergency message
   and it will get through.

3) Lower power and handheld beam for mode J UHF downlink is consistent
   with Other AO27, UO14 and UO22 operations (and possibly future KO23
   and TO31 if we ever convince community of its value)

4) ALthough Mode B gives MUCH Improved unattended satellite downlink to
   Mobiles for message delivery,... I think this message direction is
   the lesser objective of mobile satellite comms... Is he listening?
   Conversly, a mobile with something to SAY or wanting to CHECK for
   incoming traffic will then take the trouble to stop the car, pull over
   and take any added trouble to receive if he is expecting a message. Or
   his easier mode J uplink will enable him to to QUERY for any inbound
   traffic WHILE he is listening.

5) After an extended period of testing these many possibilities on SUNSAT,
the only viable long term operations will be by consistency. Mode
hopping on satellites is very dissruptive to users. <grin>.

6) UI IMAGE downlink MISSION is probably not the driving factor as far as
the mode is concerned. Only a few capture stations are needed and they
can do what is needed to bring the data down.

7) All these problems with mode B go away if 2 meters is also used as the
uplink. But this DOES significantly impact UI Broadcast delivery, and
may have other command station issues.

See you tomorrow... I will focus 100% on HT operations tomorrow.

138. [htaprs] Re: [aprssat] SUNSAT WOrks Rev2

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 15 Apr 2000 00:57:09 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org, Robert Bruninga <bruninga@arctic.usna.edu>
Message-ID: <LYR845-77600-2000.04.14-23.57.59--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

ON THE OTHER HAND...... Mode B is the way to go:

1) Message delivery to HT in pocket
2) Message delivery to mobile in motion in foliage
3) Totally unprepared user without a clue as to when the pass will
    occur in the wilderness WILL capture messages, and DONWLINK
    noise will alert him to pass-in-progress
4) Lower power demand on Satellite
5) No-track-no-tune download stations for UI data
6) User can respond and make more effort for uplink as needed.
7) The other pacsats provide good bench mark for mode J. SO let
    SUNSAT explore and validate the many advantages of MODE B.

8) Future Mode B satllites with 30 KHz UHF receiver will completely
    eliminate the uplink doppler tuning problem
9) Anyone can hear it, on ANY HT with ANY rubber duck. Great incentive
    for users to finally move to 9600 baud.
10) Great for PR, DEMOS, and message delivery. Have HT, will demo
11) No-Track-no-tune Igates can feed this stuff into APRServe to extend
    The message system worldwide
12) Similar Igates can return trafffic from APRServe to end users in the
    field.
13) Any loss of performacne on the UHF uplink can be easily made up with
    a 25 watt amp and still use an OMNI antenna. Very low duty cycle
    could package 25W amp and AA nicads into a cracker Jax box.
AND MANY MORE.

SO Mode B is certainly the winnner here... (another hasty, premature,
conclusion...)

139. [htaprs] Automatic Wx Objects and D700

From: "Dale Huguley" <kg5qd@worldnet.att.net>
Date: Sat, 15 Apr 2000 11:53:59 -0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-77697-2000.04.15-06.56.54--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All-
    I will not rehash my post to the aprssig concerning automatic Tornado
and severe thunderstorm objects- this is an amplification for D700a users.

If you have an I-gate that is locally gating wx data from my parser, you
should start to receive severe wx plots directly to your d700 screen. These
are "native" objects so that by looking at the detail of the "station" you
should be able to see the position and the distance/direction from you.

So you can do one of two things:
    1. Run away at 90 degrees away from the direction of travel if you want
to avoid it
    2. Head toward it if you are chasing it.

Message-ID: <LYR845-77719-2000.04.15-10.23.37--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Results of SUNSAT Test overhead East coast USA 14 Apr 1300z

TEST SETUP:
  1:D700 Mobile 2m 5/8 wave ant on Plastic car roof (poor example!)
  2:D7 XMIT only on uplink with 14" whip sitting on plastic roof
  3:D7 A:RX B:TX on stock rubber duck on plastic roof
    Swapped Antennas on D7's about half way through

Results: D700 sigs went from S-3 to S7 (full scale) during pass
         Stock D7 rubber duck peaked at 3 segments
         Copied all 7 bulletins on D700. Copied ANQ and WQM posits
         Copied 6 bulletins on D7. (D7 will copy with S-0)

I swapped the 14" whip and stock whips on the D7's half way through
for big improvement on D7-3 reception. Copied none of my own
packets from Mobile or HT's. Did copy one packet from KB2WQM-7 D700
and one from WB3ANQ-7 on his D700.

CHRONOLOGY: Reconstructed after the pass. Remember, Radio only captures
original copy of any duplicate message, so we see here the first receipt
of each Bulletin or packet. Signals are simply S-Meter LCD segments.

1259z S3 Copied BLN Please log all...
1301z S5 Copied BLN APRS Server...
1302z S6 Copied BLN Digipeating via
1302z S6 Copied BLN High Resoultion...
1303z S7 Copied BLN UP/Dwn freqs...
1304z S7 Copied BLN Please Forward..
1304z S7 Copied BLN Contact Lochner..
1304z S7 Copied BLN WB3ANQ-9 Mobile D700
1307z S4
1308z S3 Copied KB2WQM-7 Mobile D700
1311z LOS

Next pass was USA VOice at only a 4 degree pass to my west. But mobile
copied voice to horizon for 4 minutes with signal peaking to S4. I made
voice contact with WB3ANQ

Got a new unit three weeks ago at Texas Tower with a SN # of 111-00005.
Strange to see such a low number. As we know The D7a had a few productions runs
with the first 3 numbers different. Do you think the D700A did too?
or are all units 111-xxxxx ?

---------- Forwarded message ----------
Date: Sat, 15 Apr 2000 19:35:17 +0200
From: Johann Lochner (SUNSAT)

UI broadcasting results looks extremely promising. Data has been
received from N7SFI, KB2WQM, WB3ANQ and KB0VBZ. Thanks also to
WB4APR for his feedback on the North American passes. We'll soon
have a system ready to collect and merge the increasing volume of
KISS data automatically. More information to follow.

Another 24 hour schedule for digipeating and broadcasting of image
data was just uploaded. The uplink will be 436.291 MHz (UHF
monopole) and the downlink 145.825 MHz (VHF monopole). Unless
indicated otherwise, digital services will be enabled at the
following times (all are UTC):

Japan

15/04/2000 21:20:00
15/04/2000 22:58:00 FM Voice repeater
16/04/2000 09:27:00
16/04/2000 11:05:00

16/04/2000 12:45:00

North America

15/04/2000 23:29:00
16/04/2000 01:05:00
16/04/2000 02:44:00
16/04/2000 04:24:00
16/04/2000 06:06:00
16/04/2000 12:18:00
16/04/2000 13:59:00 FM Voice repeater
16/04/2000 15:37:00

Best wishes,
Johann Lochner, ZR1CBC
Sunsat SO-35 Control Operator

I missed the 0138 pass, but the 0245 I copied KE6ZC-8 Stan (2336 Miles)
and several bulletins on the D7 HT AND I copied KB0VBZ-14 (1509 Miles)
running a NMEA Tracker! (Good GGA string). How'd he do that?

I was transmitting on a 30 second rate on Mobile and 20 second rate on HT.
Presumably you guys are also transmitting high rates. So I wonder why we
are not seeing as much success? I have never seen myself yet. Has
anyone seen themselves on the D700? Or do we need a longer T/R delay on
the satellite...?

This is clearly not nearly as successful uplink as on the UO-22 Mode J
operation... Do you agree?

Anticipating Doppler in the blind is tricky and easy to forget...

148. [htaprs] Cross Banding on the D700

From: Dale Grant <grantd@cadvision.com>

Just wondering if anyone has used there kenwood tm-d700 for
crossbanding? I recently bought the kenwood radio and normally use
crossband locally to help work those far off repeaters using my
handheld. I had noticed very good audio when transmitting from VHF to
UHF but from UHF to VHF the audio has to much base and is also
distorted. Just wondering if this is my radio which may need adjustment
or if this is a much noticeable situation among this radio. My previous
kenwood (V7) works very well for crossbanding so I was a little surprise
to hear the audio coming from the new kenwood D700.

Hello Group
 I'm using the kenwood THD7 however As with the other pacsats I digi off of
I don't put the thd7 in aprs mode.   Because of the 9k6 limitation. SO i have
an easyer way.
 I hook the thd7 to a dos computer and and get paket6 running. At the start
of the pass I run a script file. It changes the baud and the frequency.
Unproto string and such. After the pass i run another script file to change
back to 1k2 and local paket/aprs frequencys. Seems for Sunsat I used 436.285
for the uplink.

I can post the sunsat script file. here If anyone uses paket6 and wants it.
Rick

Bob,

I bought mine from HRO Atlanta in February and the s/n is 100-000208. Ron,
W5RKN, got his from somewhere in the NW a couple of weeks ago and his s/n
is 111-0001??

Don't know what that says, other than there were probably several
production runs.

These stations have been seen: WB4APR, W3ADO, WB3ANQ, N5ZNL, KB2WQM
KE4SLC, W5ACM, KE6SZC, KB0VBZ, KB2WQM.

I have never seen my own packets. I suspect that the Satelite is so quick
on the full duplex downlink, that we wont see our own packets unless there
is a delay built into the satelite. ALso, Johann asks what DIGI call you
were using? I was using SUNSAT. But we need to verify that it does
callsign subsittution on APRSAT too.. (any SSID).

THis will be the last routine cross post to HTAPRS SIG that I will make,
and I will try to keep all my posts to just the APRSSAT sig. Hopefully
this will cut down the wear and-tear on your "D" key.
---------- Forwarded message ----------
From: Johann Lochner <SUNSAT>

Thanks. Digipeat via SUNSAT (any SSID) or APRSAT-0

> Question. What is bandwidth of your 436.290 Receiver? This is to
> decide if we need to anticipate +/- 9 KHz of doppler or if we can
> use just +/- 5 Khz...

>From the web page for the FM voice repeater: "The centre frequency
for SUNSAT's uplink is 436.291 MHz. The IF bandwidth is 18kHz, and
the receiver has about a 3kHz AFC capability, so you can probably be
up to 9kHz off-frequency for voice. On an overhead pass, the Doppler
shift at AOS is almost 10kHz, so to be spot-on, you should be
uplinking on 436.281 MHz, and on 436.301 at LOS. Since you may be on
the side of the pass and get lower Doppler shifts, we suggest you
uplink at 436.285 MHz in the first part of the pass, and shift up by
10kHz once SUNSAT has passed overhead." So the +/- 5 kHz should do.

> Observation: Since I have never seen ANY of my packets digipeated,
> yet your lists shows many, this tells me that a Half-duplex station
> (the way we will be operating the Mobiles and HT's) cannot hear
> their own digipeated packets due to the very FAST T/R on the
> satelite.

Currently packets are digipeated immediately on reception. The next
software update (which will hopefully happen at the end of May) will
add packet clustering, configurable delays, etc.

We are performing GPS experiments on Monday mornings. Normally there
are no voice or data passes on Mondays. However, tomorrow after the
experiments, the digipeating and UI broadcasts will be active (times
are UTC; uplink will be 436.291 MHz and downlink 145.825 MHz):

Rendered body type: text/plain

I get the same problem when I transmit from VHF to UHF. I just use partial
cross banding (full is not quite legal without the ID, but that is another
point). When I transmit on my HT on 445.3, the D700 re-transmits that onto
146.02. I get reports that the audio sounds muffled. I also get some reports
of data noise from the GPS.

155. [htaprs] Mounting D700 on a cell phone mount

From: "Thomas M. Schaefer" <toms@inconnect.com>
Date: Mon, 17 Apr 2000 12:32:44 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-78187-2000.04.17-13.31.03--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am getting a Panavise cell phone mount that connects next to the radio in my car. The mount presents a flat vertical surface parallel with the radio. Now that I take a closer look at the hardware that came with the D700, I cannot figure out how to mount the face plate flush. The bracket that snaps into the back only has screw holes on the bottom. The "fan" with the tape on it, will go parallel to the faceplate, but that would look dumb. Has anyone mounted the faceplate on a mount that was parallel to the faceplate.

Thanks,

Tom NY4I

Rendered body type: text/plain

Today I had a Citadel computer hooked to my THD7 on my desk at school and had I running APRS, I had flipped the display to look at packets received and noticed that KA2BQE-8, my D700 in the parking which was set to digipeat was IDing and sending posits via WIDE,WID. The Posit and Status beacon from KA2BQE-8 were being transmitted, then heard and digipeated by KA2BQE-3 (Wide digi at my home 6 miles away and then being digipeated by KA2BQE-8 again on the second wide. This was no fluke, it was doing it all day! This isn't right is it?

  The stuff from the desktop D7 set to WIDE,WIDE,WIDE and digipeated through BQE-8 was not being re-digi-ed by BQE-8 after going out through BQE-3.

THe D700 is going out via WIDE,WIDE. After it hits your house on the first hop, it then comes back and hits your mobile digi. THus, 2 hops just as you would expect.

This might be what you would expect from a tnc2 tapr digi but jou would
think that a d700 would ignore its own frames.

ah well just a reason more to use a software based digi and not count on
comercial solutions.

From: Johann Lochner

Please find the schedule for the next 24 hours below. Generic and
aliased digipeating (APRSAT) will be enabled. APRS anouncements,
APRS bulletins, APRS status, APRS telemetry and UI broadcasting of
image data will also be active. The uplink is 436.291 MHz and the
downlink 145.825 MHz.

Packets addressed to any SUNSAT SSID will be digipeated by that same
SSID. Packets addressed to APRSAT (APRSAT-0) will have the callsign
substituted by SUNSAT (SUNSAT-0). All APRS bulletins, status and
telemetry originate from SUNSAT-3. UI broadcasted packets originate
from SUNSAT-9.

161. [htaprs] Time change & the D700

From: "Thomas M. Schaefer" <toms@inconnect.com>
Date: Tue, 18 Apr 2000 15:09:29 -0600
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-78443-2000.04.18-16.07.29--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

After daylight savings time went into effect, I changed my UTC offset on the
D700 to -6 rather than -7 (for Utah).

When I push POS I get my correct local time.

However, when I look at the time any packets are received, they are all an
hour behind. It looks like the code to figure out when a packet is received
is not using the new offset. For example, the current time displayed on the
POS display is 19:45, the packet I just received (in List) is displayed as
18:45. This happens for all the stations in my list.

Does anyone notice something similar?

Tom NY4I

Is it possible to receive AM aircraft on Band A?

I know you cannot in Band B, but I thought Band A would allow it? When I
change bands with the VFO (F + Knob A), it only cycles through 144 and 220.

Any thoughts?

Tom

Rendered body type: text/plain

I went to the FOSE show today(Federal Computer show in DC) and got to play
with one of the NEW Windows based Palm PCs that will be released on WED, 19
APR.

I have and love my Palm Pilot IIIc (color). I have not liked the Windows CE
boxes.

However, the NEW PALM "PCs" may have finally beat out the Palm Pilots.

The new Palms, at least the one I played with from one manufacture is color,
has a PCMCIA slot, serial port, USB port, stereo headphone jack.

Same shape and almost the same size as the Pilot. Has a docking station like
the Pilot.

Runs a "new" version of Windows CE, which the rep. said was NOT CE.... but
more like Windows.

Has built-in versions of Office, Outlook, yada, yada yada. Comes WITH a
mapping program.

All for $499. That's $50 more than a IIIc.

Looks like it will be a great APRS platform!

Subject: [aprsplus] weather station?

I am trying to help one of the local ES directors setup there EOC and they
have a davis weather station.. Is it possible to hook this up so it will
send out weather reports? if so how.. and is there a place on the web that
will give me more info..

Hi Tom,

Page 90 of the instruction manual sez yes, but I cannot
play with it since it is mounted in the car. You may be
forgetting a step or two to get it to go to 118 mhz...
Good luck es 73

Robbie

The post that it depends upon theband in Band B was the winner. If Band B is
in memory mode, then you can select 118 in band a. Strange...

Thanks,

Tom

 I had the same problem; you have to set the new offset, then go to POS and
do a SETTIME and then it seems that it doesn't go back and correct any old
LIST entries but new ones will have the right time.

Because LEO.ORB has MIR as "MIR_" the regular Keps from ARRL or AMSAT do
not update MIR since the name in those files is just "MIR", you need to hand
edit it quickly before using to update the KEPS via Input-Keps

Hi All

I am planning to buy a new mobile rig in the next week or two. I have
narrowed the choices to the D700 or the yaesu 8100R. I have picked these
two because of the extended receive options. I have limited space for
mounting and I am into scanning as well as 2m 440 and aprs. I also already
own a D7 and a GPS III+. My question for the group (finally you say :-).
Is how the D700 works in its various scan modes. I have downloaded and read

the manual, but it is not very clear, at least to me. Can you actually scan programed frequencies say from 118-470 all at the same time, realizing it might take both bands to do this or can you only scan one band or or a sub band on each side at the same time.

Thanks in Advance

KC5UWA

   Yes, but you made the mistake of actually believing the rep. :-)

   The OS is *still* Windows CE. However, Microsoft has crashed and burned so incredibly badly in the pocket market that they've been forced to rename it to distance themselves from the WinCE debacle. It doesn't surprise me that the reps are stooping to lies about the OS.

Rendered body type: text/plain

Just got my call sign today (3 weeks post Technician exam) so I'll be on the
air after work. I've spent the interim doing lots of listening and learning
about my D7.

I picked up the Kenwood 3 function speaker/mic (can't recall the exact name)
for use with my D7. I can't figure out if the functions are programmable.
The mic instructions refer you to the transceiver manual for programming
information but the D7 manual only shows a schematic of the speaker/mic's 3
switches. No info regarding their default functions and nothing about how to
re-assign them. The defaults seems to be A/B band switching, VFO/Call
channel switching, and something else that didn't appear too useful.

Anyone know if it's possible to re-assign the buttons? Perhaps via the
Kenwood CDROM software & cable (I'm still waiting for my free one to
arrive)?

I will be using my D7 a lot in my car. I've fashioned a cellphone style
mount that works quite well. I was hoping to use the speaker/mic while
mobile, but the more I play with it, the less I like it while driving. What
do most HT users use while mobile...headset/boom mic with VOX/PTT or lapel
mics?

:- Rich

Marketing... lying... what's the difference? :-)

I'll preface this by saying that I am *not* a Microsoft apologist. Yes, I
am the author of APRS/CE, but don't assume that I am rabidly pro-CE and
anti-Palm (or anti-anything else) because of it.

CE certainly has gotten a bum rap, but... I've owned about six CE devices
and have coded/tested/debugged using each and every one of them. The only
time I've ever seen the CE equivalent of a GPF is when I've made some
egregious memory mistake with APRS/CE - e.g. freeing something twice, using
a null pointer, et al. I don't really know if there's an equivalent to the
famous Blue Screen of Death (BSOD) - I've certainly never seen one. I
have experienced the "pause" or "slowdown" effect that some have seen.
I've attributed it to garbage collection and memory defragmentation. The
machine has always recovered within about 15 seconds. (I hope this is fixed
in Windows CE 3.0!)

If Windows 95 or 98 ran like this, I'd be able to run it for six months
straight. (Yes, I know about Linux, having two servers in my house and a
partition on my development box. Yes, I know it beats the h*ll out of
anything Microsoft offers for stability, reliability, etc.)

Part of the reason CE appears to be more stable than its desktop cousins is
related to the fact that the OEM builds a brand-spankin'-new kernel for each
new type of CE device that rolls off the assembly line. With the exception
of memory or other standard CF card add-ons, there is no variation in the
hardware - every box looks the same. If the OEM can tweak the build to work
reliably on box #1, then it will work the same on box #100,000.

I do think Microsoft was trying to cram way too many desktop-like features
into a small box. Why in the name of abandoned logic would you put

grayscale 3-D buttons on a 4-gray screen that's already (a) crowded and (b)
hard to read?

I also think that only being able to muster a 25% market share (+/- 5%) has
given Microsoft a needed "boot to the head". I imagine that they've had to
return to the drawing boards to figure out what they were doing wrong.
(Here's a hint: Take a look at what the market leader, Palm, is doing
right.)

>From what I've seen of the new Pocket PC devices, the interface is *MUCH*
better. The new hardware (a) is smaller, (b) is lighter and (c) has just
enough goodies without sacrificing (a) and (b).

I guess my point is, cut through the poorly-researched reviews and the M$
marketing hype and try one of these things out for yourself before passing
final judgment. CE may not be as bad as you were led to believe. ;-)

Finally, yes, as soon as I can get my hands on a Pocket PC, I'll make sure
APRS/CE is running on it in living color!

     -Rob

P.S. If anyone has a Compaq Aero 15xx out there, you'll be pleased to know
that Compaq will have a ROM upgrade to Windows CE 3.0 (Pocket PC).

It's in the manual. With the buttons unlocked, turn the D7 on with the
button you want programmed pressed down. It'll blink PFn (where n=1 - 3).
Press the buttons for the function you want stored in the button. I use
the following:

1   -   Band Switch
2   -   VFO/MR Toggle
3   -   Call

One problem I noticed this past weekend was that for some strange reason,
when receiving a signal and listening to it on the speaker mic, the D7
would suddenly change frequency! This happened twice. The radio was
sitting on the table in front of me, as was the speaker mic. Neither the
radio nor speaker mic were being touched. It seemed as though the sound of
the voice I was receiving was triggering the radio to switch frequencies.

Funny that you would say that, because the same thing happened to me in the
car. It just jumped frequency for no reason....
Most of the time that it happened for me was when I drove by paging towers.

Paging towers should have nothing to do with this situation.

I had a similar situation amonth ago, I lost most of my programming in my D700 (but not all) while driving down I-40 in rural western North Carolina. I watched it burp and toss most of my settings to the four winds. Since I have reprogrammed it, nothing more like that has happened.

However, I tried the W601 and W602 mods. I quickly replaced the resistor and wire when my GPS output was apparently crossed over my mic circuit, causing my voice to be obliterated by the data stream every second by my Garmin 12. In short, my suggestion is just don't do it.

Todd Ellis, N2XL

Rendered body type: text/plain

Has anyone used the DB9 connector on the D700 to hook up a GPS Unit instead of the 2.5mm connector?

I have a Garmin GPS40 with the power and data cable. The data connector is a DB9 with pin 2=data out fm GPS, pin3=data in fm GPS and pin5=Ground fm GPS. This would equal to RXD,TXD and Ground on the D700 DB9.

Any assistance would be appreciated.

Can someone give me the part number of the mic? I have yet to receive the new catalogue from HRO.

Thanks.

Peter

Yes, you can reprogram those functions to do many things. This info can be
found on page 44 of the manual. This page covers Microphone Control. (This
is page 50 in acrobat). The manual can be downloaded from here:
http://216.98.255.24/Amateur/Instruction%20Manuals/

Enjoy,

Walter

"Yes, but you made the mistake of actually believing the rep."

DID NOT make a mistake!! Never said I did believe!! "..which the rep. said
was not Win CE.."

RTM.

It was the HP rep. not the Microsoft rep.

All these messages of attack between the Palm Pilot/CE/don't have anything
crowd, reminds me of the ICOM 756PRO debates/attacks on the ICOM reflector.

jezz

Kent

   Yes, but you made the mistake of actually believing the rep. :-)

   The OS is *still* Windows CE. However, Microsoft has crashed and burned
so
incredibly badly in the pocket market that they've been forced to rename it
to
distance themselves from the WinCE debacle. It doesn't surprise me that the
reps are stooping to lies about the OS.

You only need pin 2 and ground, and thus the separate 2-conductor plug will work for you. I tried using the DB9 and it didn't work for this application. you're going to have to hack off one end of the cable and attach that silly jack to it I'm afraid...that's what we have all been doing.

I opened up my DB9 and soldered on a pig tail that terminates to a 2.5mm connector. This way I can use the gps with the computer or radio.

185. [htaprs] SSID Routing.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 20 Apr 2000 10:44:07 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-78816-2000.04.20-09.46.07--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The D700 has a new feature for APRS networking that has not yet been
exploited. My original vision for APRS routing back in 1994 proposed the
WIDEn-N and SSID routing mechanisms. PacComm added Callsign substitution,
then Kantronics implemented the WIDEn-N and now Kenwood has implemented
the SSID routing in the D700.

ALl Mic-E's and Kenwood D7 and D700's and all other TNC's can take
advantage of this SSID routing technique.

One power of the SSID routing is the further shortening of packets by
eliminating the 7 Byte DIGIpeater callsign from every packet. This is
like WIDEn-N but you only use the N. Here is how it helps the APRS
network for a four hop Mic-E packet.

1994: W4APR>APRS,DIGIONE,DIGITWO,DIGITRE,DIGIFOR:'lllcst/$
1997: W4APR>APRS,SUBSONE,SUBSTWO,SUBSTRE,SUBSFOR:'lllcst/$
1998: W4APR>APRS,WIDE4-4:'lllcst/$
2000: W4APR>APRS-4:'lllcst/$

Notice the more than 50% shortening of the packet. And even the 25%
savings over a WIDEn-N.

The other feature of the SSID method is in NORTH/SOUTH/EAST/WEST
directional routing. The SSID's between 8 and 11 choose these directions
and the SSID's between 12 and 15 select additional hops in these chosen
directions.

In the D700 you will notice 4 additional UNPROTO paths labeled NPATH,
SPATH, EPATH and WPATH for the 4 directions. If the digi sets these to a

fixed digipeter path in those directions, then an incoming packet with
SSID = 8 (NORTH) will then be routed by the NPATH, etc. If the SSID is
12 (NORTH+) then the NPATH will be used PLUS an additional WIDE is added
on the end.

Notice, the SSID digipeater code in the D700 only applies when that D700
is used as a FIXED DIGIPEATER. These DIGI settings do not apply to the
user while he is mobile. But if somone installs a D700 DIGI network, then
mobile D7 or D700 users simply select their outgoing PATH as the single
digit N to use this capability.

As we go to more and more users, and therefore smaller DIGI areas, these
compact and effecient routing methods may not be as necessary as they were
originaly envisioned. But for special applications where you can put up a
network of D700 digis, this may help improve channel loading. Also
others of you writing "smart" digipeater code should consider implemening
these in your digi...

If anyone experiments with these methods we would like to hear of your
experiences.

I had the same problem last summer until someone suggested that I set the
switch on the back of the mic to enable the buttons. It's not the best
solution since the programmable buttons are always enabled but that fixed my
problem.

Rendered body type: text/plain

Greetings;
    I have a question about the P.MON function on the Kenwood D700. If you have this turned on and waiting to log raw aprs messages, why is there a cmd: line displayed along with a date / time stamp every 21 seconds exactly? This only fills up the buffer and shifts out any old aprs data you may have had in the buffer. And more important, is there a way to turn off these cmd lines? Appreciate any help. Thanks
     Bob N0TI

188. [htaprs] Re: D700 P.MON

From: Dennis Hudson <dennis@zone5.com>
Date: Thu, 20 Apr 2000 13:45:34 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-78840-2000.04.20-12.48.12--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

You think that's bad, you should see my pmon fill up nearly instantly with

$GPRMC,231206,A,3820.9939,N,07624.4219,W,0.000,0.0,100199,10.9,W*40
GPSTEXT was $GPGGA

Then followed by

$GPGGA,231207,3820.9939,N,07624.4219,W,1,04,1.23,-35.1,M,-33.9,M,,*55 with
GPSTEXT was $GPRMC

I have a tripmate which I assume that I cannot control what gps sentences
come out of it, so It constantly changes the GPStext on the TNC I hope I'm
not messing anything up or beating up the processor with this setup. Is
anyone else using a tripmate with D700 see the same thing? Is there a way to
force the D700 or tripmate to only use one kind of GPS string without adding
a PIC processor for the data stream? Do I always have to look at the GPS
stream in PMon?

The CPU must interrupt the TNC each time it wants go get a GPS fix. SO
the P.MON mode will see all the internal CPU to TNC handshaking going
on...

You will also see the changes in UNPROTO mode each time a message is sent.

191. [htaprs] Kenwood D700 via Satellite

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 20 Apr 2000 19:40:49 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Cc: htaprs@lists.tapr.org
Message-ID: <LYR845-78896-2000.04.20-18.41.48--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is a list of the D700 TNC commands that are forced into the TNC in
APRS mode. All of these values in PACKET mode are REMEMBERED in their
previous state for when you go BACK to PACKET mode.

```
    8BITCONV ON
    AFILTER 0
    CR ON
    DIG ON/OFF
    DWAIT 0
    ECHO OFF
    FLOW ON
    GBAUD 4800/9600
    GPSFILT1 %
    GPSFILT2 %
    GPSFILT3 %
    GPSFILT4 %
    GPSMON OFF
    GPSTEXT $GPRMC/$GPGGA
    HBAUD 1200/9600
    HEADERLN OFF
    LOCATION E 0
    LOOP OFF
    LTEXT %
    LTMHEAD OFF
    LTMON OFF/ON
    MCOM OFF
    MCON OFF
    MONITOR ON
    MYCALL callsign
    PACLEN 128
    PPERSIST ON
    SENDPAC $0D
    TXDELAY 50
    TXUIFRAM ON
    UNPROTO APK101 V path
    UIDIGI ON/OFF,call,call,....
    XFLOW OFF
    XMITOK ON
```

But it is also important to note that BEFORE the radio WRITES these new
TNC parameters to the TNC in APRS mode, it SAVES in EEPROM the previous
values that were there from TNC-PACKET mode. Thus, when you operate
TNC-PACKET mode you will always get your last settings, even if some of
those are changed when you go ina-and-out of TNC-APRS mode.

Hope this helps.

I enabled Automatic Power Off APO feature on my D700 and expected it to
turn itself off after 3 hours as indicated in the manual on page 70. It has
been on 10+ hours and I haven't touched it. Are there some circumstances
that keep it ON even when the APO item is selected.

thanks in advance,
Rich Parry, W9IF

Last night while operating SUNSAT VOICE REPEATER mode in my van I was
surprised to see my D700 flash a posit from WB3ANQ. I never "heard" it on
the downlink, but there it was. So SUNSAT Voice repeater appears to have
enough audio bandwidth to pass 9600 baud as well.

THIS MEANS we can run 9600 baud PTT mode and if our VOICE gets through,
then our 100ms "APRS" identifier will get through TOO! AND it won't sound
like packet so the VOICE users will not be the wiser. I am not advocating
using "APRS" on VOICE satellites, but it does not hurt to have the 100ms
ID on the end of your transmissions if you are going to be using VOICE
anyway!

See ya on the bird!

Bob, I would suggest that ID/position AFTER voice is really the only
proper way to use a voice repeater with APRS. You might want to tread
slowly with this one! Cliff K7RR

Is it not true that APO activates if the radio has not
heard any rf signals in the prescribe amount of time? I
would think that in a dual band radio, one would need
to live in my home town in Arkansas not to hear some
sort of activity in three hours! ;-)

Rendered body type: text/plain

I recently purchased the TH-D7 and have a Delorme Tripmate (early model)
that I would like to use to feed GPS for APRS. I cannot find any info
on the pin outs for data on the Tripmate cable that has
a DB-9 plug for a laptop connection. Delorme could not help
me as they say unit is only plug and play with their mapping
software and computer. (That system works well, but GPS is a power hog) It
is my hope that someone is running this GPS with the TH-D7 and can give me
the data pin out info to get the combo working, or recommend
a good reliable alternate GPS.

I use that combination and it works very well.. Go to any of
the APRS web sites that have links to some excellent GPS
hookups for the correct hookup/mods you can or not make for
YOUR application...

One comes to mind, www.dididahdahditdit.com

Enjoy, es 73!

Hi John,

I used this mode a couple times myself. Not sure now, but
make sure you have the settings configured to except GPS
data.

Go to Settings/TNC/ and check GPS on VHF.. Also, I think you
have to click on PICO on VHF.. This all may be explained in
the Help File as well John..

Good Luck es 73

Rendered body type: text/plain

Hello all from a Ham in England interested in using APRS,
Is there anyone out there familiar with the Psion Series 3 Palmtop
Computers ? I am planning to buy the Kenwood TH-D7 Data Radio.
But, although I have found a split-screen Packet program (called PocPac
by Roger G0HZK, also for the Series 5) cannot find any APRS software for
it so if anyone out there knows of any can they please let me know.
73's
Stephen G7EXZ
g7exz@qsl.net
PS if there's anyone out there who can program in OPL etc for the EPOC
Operating Systems on the Psion's, there are a couple of possibilities as
there are to my knowledge two mapping programs already in existance
AutoRoute Express ver 1 by Microsoft or Mapper 3a by Steve Litchfield.
I'd be a willing Beta Tester as I have both!

204. [htaprs] Announcing TinyTrak

From: "Byon Garrabrant" <byon@mail.com>
Date: Sun, 23 Apr 2000 15:50:09 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-79465-2000.04.23-17.56.47--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

After several months of development, and over a hundred beta
testers all around the world, I am pleased to finally announce
TinyTrak.

TinyTrak is an inexpensive APRS tracker which can be built using
relatively few parts. It replaces the need for a full TNC in a GPS
based tracker, and sends position both automatically, and/or
manually at the end of a voice transmission, like the MIM/MIC-
E/PIC-E. It is powered by a PIC16F84 microcontroller, and
operation parameters (callsign, path, timing, etc.) are set from a
Windows configuration program.

More details can be found at the TinyTrak web page at
http://www.byonics.com/tinytrak . The site contains a

downloadable ZIP file with firmware, software, schematic, pictures,
and documentation. The web site also contains a message board
for users to share questions and comments. A PCB is available
from FAR Circuits, and complete kits are available from the above
web site via credit card.

Thanks to all the beta testers who sent me comments, questions,
recommendations, and confirmations of a successful project.
Please do not re-distribute the zip file or the contents. TinyTrak is
for personal, non-commercial use only.

73,
Byon

Rendered body type: text/plain

There isnt much happening with EPOC16 any more - I did make a start
with a text only aprs system for the 3a/c/m but that fell by the wayside-
I keep meaning to resurrect it :(It uses Roger Muggletons comms routines
from pocpac actually.. good egg is Roger.

The UIVIEW message format was a PITA to operate from the psions terminal
program, but APRS format messaging is fairly easy if you capture some
samples and look at it - you can even manually type ACK messages. Appeals
to my pioneering instinct - I was doing that mobile ...eeeee before the
THD7 even was a twinkle....etc.etc..

Of course the compressed and MICE packets wont make any sense, but
the conventional ones can be decoded by eye.

As regards mapper3a, that does a nice job of showing your location
when you connect a GPS. It keeps my 10y old quiet on long journeys.. :)

Rendered body type: text/plain

www.frequencymovie.com

[PR:857] Frequency, a review
"Frequency" is an imaginative fantasy based on the complex
 relationship between fathers and sons.
>From a ham radio standpoint, given the movie's conceit, it could hardly
 have been better. The conceit is, of course, communicating through
 time, in this case the son in 1999 and the ham father, W2QYV I think, in 1969.
     It's hard to believe that this movie was not written by a ham, or
 perhaps the son of a ham. Here is a picture which in an oblique way will
 convey the lure of ham radio to the uninitiated. Long suffering spouses of
 hams should leave the theatre nodding and smiling.
      Any ham club which can get it together to give demonstrations of
 ham radio in action in front of theatres playing "Frequency" should get a
 lot of interaction from the crowds leaving the movie. Since a number of
 equipment manufacturers are offering prizes for the best ham demo, and since it's a

very entertaining film, any club with the ability should make arrangements ASAP for a "movie field day." There is a terrific PR opportunity here.

The director and writer take care at the beginning of the ham radio sequences to go pretty much by the book, but as the movie progresses they move slightly farther from real ham operating procedures as the movie itself moves farther from day to day reality. There's a wonderful scen where little kids "want to talk on the radio."

Starring Dennis Quaid in perhaps his most moving performance ever as the firefighter ham from the 60's and relative newcomer Jim Caviezel as his son who's not a ham but knows how to push the mic button, "Frequency" moves at just the right pace for the audience to follow the complex happenings on screen.

There's a serial killer sub plot which will undoubtedly annoy some real critics, but from my perspective it worked just great, heightening the tension and picking up the pace as it shifted ever back and forth between the 90's and the 60's.

There's no doubt that the ending is a bit saccharine, but it is a fantasy after all, and ends as all but the most cynical want fantasies to end.

Baseball fans will enjoy this picture almost as much as hams because an important plot turn involves "predicting" the outcome of the Mets-Orioles World Series of '69.

The acting is uniformly good, with Shawn Doyle really creepy as a demented killer and Andre Braugher very believable as a cop in both the 60's and the 90's. (Like all of us, 30 years has made him a little porky.)

As my friend Alan Kaul, W6RCL, said as we left the preview, "It's a really good example of the law of unintended consequences." And if you don't know what that means now, you will when you see the movie. And I urge you to see it the first weekend it's released. I hope you enjoy it as much as I did. I'm going again. CU at the movies.

73,

Dave, W6AQ

==========

A number of clubs are planning amateur radio demos at theaters
where the movie will be playing. What about your club.
The League in cooperation with a number of
manufacturers are offering prizes for the best exhibit.
See www.arrl.com for more details.

==========

WHAT'S THE FREQUENCY, KENNETH ???????????
Local club putting together a special event station/educational/informational
one stop event @ local mall/cineplex.....HF/VHF/APRS/Packet/ATV/SSTV
A virtual "Taste of Ham Radio".....Any Ideas on a "national" QSO FREQUNCY?
Need 80/40/20/15/10 in General section of band to voice QSO with other
stations doing the same thing.....would be easier for mike shy "civilians" to
discuss movie twix & tween.....Who knows? Maybe one of those MAXIMUM
SOLAR FLUXXES might hook us up to the old man, W1AW hisself.....???!!!!

Rendered body type: text/plain

Need some information concerning the TM-D700A as a digi.

Will the D700 digi a WideN-N path? If so, what settings have to be made? Had Digipeater "ON", UIDIGI "Relay, Wide".

The reason I am asking, over the weekend we were attempting to set up locations for digis for a bike race in June. We had a D700 set on a mountain with a good view of the course and it would not digi the position of the vehicle on the course. The vehicle was using a wide3-3 path and would not digi thru the D700 but when changed to a relay,wide path all was well.

Thanks for all information,
Larry KB7WWP

In my May QST Digital Dimension column, the link I mention for downloading UIDIGI16.ZIP is kaput. As an alternative, you may download UIDIGI16.ZIP from the TAPR Web site directory
ftp://ftp.tapr.org/software_lib/tnc/

The accompanying text file, uidigi16.txt, can also be downloaded from the same directory.

Hello,
last year in this group there was a discussion regarding the following
subject :
Which Garmin products show received APRS stations as waypoints on their
moving maps while connected to a TH-D7 (This radio can send
$GPWPL-Type NMEA-Protocols towards a GPS-Receiver)?

What i couldn't find was the final answer for all the actual models.

As far as i know, it works fine with the GPS III, GPS III+ and also
other elder models without map-display (like GPS II, GPS II+ aso.)

I am NOT sure about the Streetfinder and the new interesting GPS 162.

The eMap is said to be NOT usable.

Who can help ?

Hi APRSologists,

Have just subscribed to the list......
First of all, are there any searchable archives etc?
Next........I am considering the purchase of a new
Kenwood TH-D7 HT and have some questions.
Is there a dry cell battery holder available?
Has anyone used a duplexer, with 2 seperate antennas?
The Australian agent quoted AUD$180 for the PC cable,
is there a cheaper alternative?
Can this radio be used on 9600 baud FM Sats (UO22, KO23, KO25 etc)?

Any help appreciated

I have one, but between the rechargable battery and the Kenwood 12v adapter,
I have never used it, I suppose it will be good for an emergency. It is
listed in the AES Catalog as BT-11 - "4 AA battery holder" $us 17.95

Here is the AES web page, I dont know if it is listed there:

On Wed, 26 Apr 2000, Jack Chomley asked about the THD7:

> Can this radio be used on 9600 baud FM Sats (UO22, KO23, KO25 etc)?

Yes, Just hook to 2m 20" vertical whip antenna on the roof of your car
and using your laptop you will receive 9600 baud packets from all 5 of the
9600 baud birds. WIth the existing THD7, you cannot transmit (TNC is not
wired for cross band ops). But it makes a great 9600 baud PACSAT
receiver..

In order to show received stations from APRS radios the GPS receiver needs to be two way NMEA complaint. The Streetpilot and E-map series of receivers are NMEA out only. That is they can send out from the GPS the NMEA data stream but can not receive NMEA data in. I asked Garmin way theses units were not NMEA in and out and they said it was due to limited code space in the units. You can go to the Garmin web site and look at manuals for any of their GPS receivers and if they do not have NMEA in and out capability, especially the NMEA in they will not display received APRS stations.

While this argument is reasonable for the bargain-bin E-map, the idea that
the Streetpilot, at it's price point, is "code space limited" is absurd.
This feature's in the 12XL for crying out loud. Code space required to
parse a waypoint sentence is vanishingly small.

The real reason is that Garmin simply does not know how many sales of a
high end GPS they are losing by not supporting this very simple feature.
If they knew, I expect that a firmware release addressing this issue would
magically appear.   They have a reputation for correcting their mistakes,
when informed of them.

Brian,

Garmin knows that they are missing out on a market potential here. Myself and several other hams I know
have written Garmin expressing that we were not purchasing the Streetpilot because of lack of an NMEA IN
 feature. This we did well over a year ago. More than enough time for them to correct the problem. They
either do not care or can not do anything about it.

Rendered body type: text/plain

I just got back from a preview viewing of Frequency. I concur completely
with the attached review. It was a great movie and will surely get some
people at least wondering about Ham radio. My wife has never been all that
excited about my Ham hobby and I can't say she liked the movie much
(unfortunately). She's not really into fantasy sci-fi type stuff and she
found the movie's frequent shifting between 1999 and 1969 to be confusing.
As for me, it was one of the best movies I've seen in a while -- and that's
not just because it features Ham radio.

224. [htaprs] Ramtest

From: "Peter ZR5DWC" <zr5dwc@iafrica.com>
Date: Thu, 27 Apr 2000 17:43:02 +0200
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-80295-2000.04.27-10.42.54--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All

Some time back I put up a posting about the ramtest on the TM-D700A and I had one person point out the address was hex for 913167 dec. I then had Karl ask me if I had any more info on this problem. Or is it a problem. Karl has sent me his results and he got some thing a bit different.

Karl S

```
cmd:RAMTEST
RAM Reset!!
ERROR ADDRESS 000def0f
 128KBytes OK
```

Mine

```
cmd:RAMTEST
RAMTEST
RAM Reset!!
ERROR ADDRESS 000def0f
RAM Check
  32KBytes OK
  64KBytes OK
  96KBytes OK
 128KBytes OK
```

Note the 32,64,96kBytes OK. Karl did not get them on his test. So do we or do we not have a problem? I don't know I have not problems with my rig so to speak so I can not say.

Let me know what you find.

Cheers
Peter

Rendered body type: text/plain

Hi All

Thanks for pointing out to me that I had a virus. This one should be virus free. I was not notified by my virus protection software till some hours latter. Reason being as it slows my e-mail down if I have it running to check all my incoming files so it only runs a scan disk after 1am in the morning.

Please read the mail from Charles Suprin to find out what to do about this virus as many of you may have it and not know about it. All the info on detection as well as eradication are in this document and many thanks to Charles for sending it to me. I would have found out about it when I looked at my task bar and see that a virus had been detected.

Many thanks again

Peter
ZR5DWC
PS sorry for any trouble that this may have caused
Peter,

Perhaps I should rephrase, My firewall thought it had a virus.
My firewall could be wrong. A more complete diagnostic arrived
later. Maybe it accidentally attached you name to someone
else's e-mail.

If it is not on your computer I apologize for the bother.

The complete diagnostic message was:
>The mail message (file: noname) sent to you by bounce-htaprs-9878@lists.tapr.org
>contains virus VBS_KAKWORM.A-M.

The following came from the symantec website. It is a description of the
virus.

VBS.KakWorm spreads using Microsoft Outlook Express.
It attaches itself to all outgoing messages via the Signature
feature of Outlook Express and Internet Explorer newsgroup
reader.

The worm utilizes a known Microsoft Outlook Express security
hole so that a viral file is created on the system without having to
run any attachment. Simply reading the received email message
will cause the virus to be placed on the system.

Microsoft has patched this security hole. The patch is available

from Microsoft's website. If you have a patched version of Outlook
Express, this worm will not work automatically.

Also known as: VBS.Kak.Worm, Kagou-Anti-Krosoft

Category: WORM

Infection length: 4116 Bytes

Virus definitions: December 30, 1999

Threat assessment:

Damage:
MEDIUM
Distribution:
HIGH
Wild:
 HIGH

Wild

Number of infections: More than 1000
Number of sites: 3-10
Geographical Distribution: High
Threat containment: Medium
Removal: Medium

Damage

Payload: Modifies the registry keys and shuts down
Windows
Payload trigger: First of any month at 5pm
Degrades performance: Shuts Down Windows

Distribution

Size of Attachment: 4116 bytes
Target of infection: Microsoft Outlook Express, Internet
Explorer Usenet Newsreader

Technical description

The worm appends itself to the end of legitimate
outgoing
messages as a signature. When receiving the
message, the
worm will automatically insert a copy of itself
into the appropriate
StartUp directory of the Windows operating system
for both
English and French language versions. The file
created is named
KAK.HTA.

The worm utilizes a known Microsoft Outlook Express
security
hole, Scriptlet.Typelib, so that a viral file is
created on the system
without having to run any attachment. Simply
reading the received
email message will cause the virus to be placed on
the system.

Microsoft has patched this security hole. The patch
is available
from Microsoft's website. If you have a patched
version of Outlook
Express, this worm will not work automatically.

HTA files are executed by current versions of
Microsoft Internet
Explorer or Netscape Navigator. The system must be

rebooted for
                    this file to be executed. Once executed, the worm
modifies the
                    registry key:

                    HKCU/Identities/<Identity>/Software/
                    Microsoft/Outlook/Express/5.0/signatures

                    in order to add its own signature file, which is
the infected
                    KAK.HTA file. This causes all outgoing mail to be
appended by
                    the worm. In addition, the registry key:

                    HKLM/Software/Microsoft/Windows/
                    CurrentVersion/Run/cAgOu

                    is added which causes the worm to be executed each
time the
                    computer is restarted.

                    Finally, if it is the first of the month and the
hour is 17 (5:00pm),
                    the following message is displayed:

                     Kagou-Anti-Kro$oft says not today!

                    and Windows is sent the message to shutdown.

                    Removal:

                    Delete the following file: KAK.HTA
                    Delete the following registry key:
                    HKLM/Software/Microsoft/Windows/
                    CurrentVersion/Run/cAgOu

Good luck.

Charles Suprin

You might be able to do this on the web. See http://www.fcc.gov/e-file/
or http://www.fcc.gov/wtb/uls/ for a starting point. . . I haven't done
any of this, yet, myself, but this may be the way to go.

Hi, I hope I am in the right place. I am looking to buy a TH-D7A and get
started with this APRS. What I would like to know is:

1. What is he cheapest store bought GPS with the most features (I read the
QST review and the author was able to to see other APRS stations with the
$QPWPL sentence) I want to be able to do that.

2. Do I need an entire handheld unit or just an antenna, if just an
antenna, what is the best?

Thanks for your help,

Hi All,

Just a suggestion...

The Garmin units have a propietary binary protocol, besides the NMEA one, to
upload/download routes, waypoints, tracks, etc. Maybe a simple PIC that
translates NMEA data from the TNC into Garmin format could do the trick.

Cheers,

Mike

P.S. I think this comes through a friend's email bounce, I will check and if
true, subscribe myself.

It would be worthwhile doing this, but is it realy possible to do the
job also with using the Garmin format ?
Does anybody already know the required commands ?

(I also will study the PDF-File being available from Garmin.)

I just bought a D7A and am up to my neck learning new modes. Does anyone
know of a company that might sell Li Ion batteries for this neat little
radio. I'm looking for low profile, light, long lasting performance. With
all of the Prizmatic and Polymer going into Digital Phones, someone has got
to have one for HT's....

Thanks

You bet, you can find maha's at many ham radio shops. Has almost twice the
capacity in the same size. Heres the link:
http://www.maha-comm.com/products/nimhbp/kenwood/index-13.htm

Pricey, as I expected, but it's great that they are available.
Do they take a special charger? The existing KW charger can't be used on
li-ions unless there's a charger circuit inside that battery pack as well.

I have used Kenwood's wall plug, but it does take almost twice as long to
charge vs the OEM because of the high capacity. Maha does make a nice multi
purpose recharger that handles lithium and NiCad packs, and this works well.
I'm not sure if Kenwoods fast charger would handle it or not.

You have to hold the voltage to within 1% during charge, or it's
fragmentation grenade time.
Check the docs on the pack, hopefully they have their own charge
electronics in there, otherwise it would be very unsafe to charge it with a
fast charger.

I think slow charge unregged is ok, but I'd have to dig out my Li-Ion
notes. We were considering them for a project, but dropped them because of
the safety considerations (our project is strapped to your arm)

Note: The "double" capacity MAHA battery for the D7A is a NiMH battery,
not a Lithium-Ion battery.

Ok, that makes more sense. The KW fast charger will do that just fine.
Li-Ions are nice, but temperamental.

Ok, I guess there are no Li Ion batteries yet. NiMH will have to do.

Now the next question. Sorry about this. Where do I go to find a patch cable
that will take me from the that little bitty SMA connector on the D7A to a
PL-259 on my beam and ground plane ....

Thanks in advance
Sam

Those SMA are a pain, but supposed to be a better connector than the others.
  I found an SMA to BNC connector at the WB0W booth at a nearby hamfest.
Everytime I go I get several since I seem to lose them easily. I have never
found a SO 239 or PL 259 to SMA connector. You can either terminate your
feedline in a BNC, or use a SO239 to BNC between the PL259 and the SMA
adapter. I don't like this - too much hanging off the top of the radio.

WB0W also sells SMA connectors so you could build your own jumper cable.
Their website, www.wb0w.com appears to be under construction, but has an 800
number.

Hi APRSologists,

I have a new PacComm DR100 single port Digi still in box,
wish to set it up as an APRS Digi for our local area.
Is there an APRS version software available for it?
If not, is there some kind of workaround to make it
APRS friendly, apart from being a standard packet Digipeater?

Rendered body type: text/plain

I have set up a web controlled TH-D7. Currently, it allows the user (or
users) to change frequencies and listen and view the LCD of my TH-D7.

Limitations: More than one visitor at a time are allowed, and everyone has
the ability to change the frequency. The visitor needs Internet Explorer,
and Netmeeting to view and hear the radio.

More commands will be added in the future, and I hope to increase the
efficiency of the interface.

Here is the link:

Hello,

  I am not too sure what this means, I am new to this GPS/APRS thing. Does
this mean we need to get new GPS units? Does this mean the higher accuracy
satellites are "turned on" for the average joe? Thanks for the info.

You DO NOT need to get new GPS recievers. The
Government should be turning off the "dithering" of the
signals sent by the satellites at 0000 GMT.. I'm sure
there should be better answers than this, so don't be
alarmed, ;-)

73!

Well, Bill Clinton has finally done something I can applaud him for! :-)
What selective availability (SA) does is to basically cause your GPS unit to
display less accurate data. The signal is intentionally dithered so that
your position accuracy is not as good as it should be. This is why if you
watch your GPS while standing still, you will appear to randomly move around
a little bit. The reason for this intentional screwing up of the GPS signal
was to reduce the accuracy that potential terrorists might have if they sent
a missile into the US or some other type of threat. Of course to a
terrorist who cares how accurate the bomb really is!

The military has always had access to the "accurate" GPS signals because
they know the algorithm used to dither the signal. Yet, with the advent of
DGPS becoming popular SA became more and more redundant.

So now you will be able to receive the most accurate data on your GPS. No,
you won't have to buy a new one.

Bill,

No - you don't need to buy a new unit. GPS signals had a deliberate and
varying error to around plus or minus 100yds.

This is why you GPS, when stationary for a period of time would start moving
you around within a 200yds diameter circle

 This deliberate error has alledgedly now been turned off, so this should
result in more accurate and consistent placement. Only trouble is, we're a
couple of hours into no SA, and it doesn't seem to have done anything
significant yet.

I can't believe Bill had much to do with it. I don't think Bill would
know a GPS satellite if it came up and bit him in the ass. I'm sure he
signed it because his advisors told him to and he didn't know enough to
argue. But hey, I'm glad!

I enabled my GPS port last night on WINAPRS and it was nice watching my
house wandering around a couple houses one way or the other instead of
wandering into the next subdivision!

Yeh, no kidding! But if the terrorists really wanted some accuracy, why
wouldn't they use DGPS? All the real good targets are near a coastline
so
there is a Coast Guard DGPS station nearby. But then I guess our
government
buddies don't think the terrorists are smart enough to figure out DGPS.
But they can figure out how to launch a ground to ground missle.

I drove to work with my StreetPilot's "on-roads" feature turned off.
Usually when I do this, it'll show me paralleling the roads and freeways
(up to 200-250 feet off the road). Today, I was on the road the entire
trip to the office... with the exception of a couple of new roads that
don't appear on the Metroguide. My biggest error was 15 ft.

12. [htaprs] URL for "SA Watch" plots since last midnight

From: Jack & John Wright <jwright@Chattanooga.net>
Date: Tue, 02 May 2000 15:29:51 -0400
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-81388-2000.05.02-14.34.46--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

John, N3FIG, wanted a URL pointer for a website which graphically shows
the difference between yesterday and today, re: GPS accuracy. Yep,
they're all about 10 times more accurate today! I had to do a complete
reset on my G-III to get rid of all those wandering "breadcrumbs" in my
residential area. Today the "breadcrumbs" re-trace themselves right on
the roads! Yea! See http://joe.mehaffey.com for what I think is the
best non-partisan GPS site with lots of equipment and software reviews,
and the "SA Watch" plots since yesterday afternoon. At 12 midnight EDT,
the difference is very obvious. Jack, KC4ZEK.

My guess is that the FAA is going to continue
to implement a program that uses GPS navigation
for ILS (instrument landing system, currently
using VHF/UHF frequencies for az/el guidance).
 The airlines are using several different FAA
TSO approved GPS units, usually 2 like units
per plane for redundancy. Most of these units
are only capable of providing course guidance
but some of the newer ones should be able to
guide an airliner down a specially designed
course with turns over terrain/congested areas
and altitude stepdowns, whereas the old ILS
only provided a few degrees straight line
guidance.
 Just my 2 cents worth!

Chris McKendry

15. [htaprs] Kenwood D-700 APRS Speech Contest

From: Keith Sproul <ksproul@hardees.Rutgers.EDU>
Date: Wed, 3 May 2000 22:00:31 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-81580-2000.05.03-21.02.45--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
====================================================================
====        Kenwood D700 APRS(tm) Speech Message Contest       ====
====================================================================
```

The Kenwood TM-D700 Radio has the ability to have a speech synthesizer
added to it. If you add this option, you can make the D700 'SPEAK' or
actually 'SPELL' APRS messages.

When you send a message to a D700 with the VS-3 Speech chip, it will SPELL the call sign of the station that sent the message.

In addition to this, if you put a percent sign '%' as the FIRST character of a message, it will SPELL the letters and numbers of the message.

For example, if I send the following message from WU2Z to WB4APR,

        %ICU2

Bob will hear:

        DOUBLE-YOU YOU TWO ZED I SEE YOU TOO

We are announcing a contest to see what kind of messages people can come up with for using this neat feature of the Kenwood TM-D700 radio and the VS-3.

==========
Rules for the contest:

* There will be three categories:

        The LONGEST message that makes sense.

        The MOST TECHNICAL message.

        The most original or funniest message.

* The winners will be announced at the ARRL Digital Communications Conference in Orlando, FL, September 2000. (Exact date not yet determined)

* Each winner will receive a $50 gift certificate from Kenwood Radio.

* APRS Authors and Kenwood employees are not eligible.

* The judges will be the APRS Authors and Kenwood personnel that are present at the September 2000, ARRL DCC in Orlando, FL.

* All decisions of the judges will be final.

* All entries must be sent by email ksproul@noc.rutgers.edu by September 1st, or delivered in person at the DCC.

* PLEASE put D700 CONTEST as the subject of the email!!!

* You must have a valid Amateur Radio License to enter.

* You do NOT need to own a Kenwood D700 or VS-3 to enter.

* You do NOT need to be a registered user of any version of APRS to enter.

* You do NOT need to be present at the ARRL DCC to win.

* In case of a tie, i.e. exact or very similar duplicate message the earliest received entry will win.

* In case of other ties, the judges opinions will determine the winner.

* All entries can be used by Kenwood and/or the APRS authors for demo and/or advertising purposes. All entries will be posted on the Web after the contest, with your call sign to give you credit.

* Entries that imply profanity or inappropriate content will be ignored.

==========

The documentation for the Speech functions of the D700 are at:

        http://aprs.rutgers.edu/D700Voice.html

There is also a copy of it at:

        http://dorm.rutgers.edu/~ksproul/D700Voice.html

(If one is down, try the other, I will keep them both updated)

If you have questions about this contest, or how the Voice option works,
please send email to me at: ksproul@noc.rutgers.edu

As questions come in, I will update the documentation if needed.

You may distribute this announcement to other places, but you must leave
it exactly as is.

Hello. I have completly reviewed and tried the steps i found at
http://www.radiohound.com/gpsetup.htm
but i still cannot get my Garmin 45 to talk to my D7. my positon screen
shows 0's and no blinking decimals or anything. besides the wiring
confusion, are there other known barriers to making this work? would it help
if i had a new GPS? (ive been looking for an excuse to get a Garmin III+
anyways).
thank you

Same thing with mine. I was very upset at the time, as I had to wait until
Digikey sent me replacements before hooking up to my GPS.

Connect your GPS to a computer terminal, like Windows' Hyperterminal,
4800 baud and you should see streams of text beginning with $GPXXX, where
the XXX is various stuff.

Connect your GPS to the TH-D7A and set your radio to APRS/NMEA. Make
sure your GPS has satellite lock. Hit the POS button and see flashing
dots with a lat/lon. To make the APRS transmit hit TNC twice (I think)
and hit BCN off then on. That should force a transmit. I hope I
remembered everything. Oh, if still no joy then put a null modem adapter
in line with your GPS cable. It could be a cable for the TH-D7A PC
connection instead of the GPS. The cables are the same except for the
wire swap that the null modem provides.

The ILOVEYOU virus hit us hard at work and as a result, very little
email has gone in or out of my workplace. If you sent
SIG-administrator-related mail to my work email address
(stan_horzepa@adc.com) early Thursday morning or later, I likely did not
get it and likely won't get it. So, please resend it to wa1lou@tapr.org.

And, for the time being, only send SIG administrator mail to the email
address of wa1lou@tapr.org.

Thanks for your cooperation,

Stan Horzepa, WA1LOU, SIG administrator

I have tried to use both my D7 and D700 in kiss mode. They both seem to
receive OK but TX does not seem to work correctly.. I have tried both at
9600 and 1200.

Is this a known problem?

Thanks,
Scott

Rendered body type: text/plain

I am trying to use a Tiny Tracker with the TM-V7A. If I remember
correctly at Dayton one year Bob B. showed us that the TM-V7A was capable
of switching to the Data band to transmit for a Pic-E and switch back to
the frequency you were monitoring. Is this true? And if so how do I
setup the radio to do so?

Thanks,
Ron Reeves

Rendered body type: text/plain

Hi,

I got a TH-D7E since about 2 weeks now and I use several programs to
program this HH from my desktop WIN95 computer. However, I would like
to change configuration and memories sometimes when on holiday and at
those times I only have a (very old) 486/25 laptop with DOS/Win3.1
combination. Is there any software around to program the TH-D7 from
win3.1 or DOS? Is it possible to program with the terminal prg from
windows and what's the fileformat to use?

Thanks.

Rendered body type: text/plain

Bruce,

The map datum is 'Ordinance Survey GB' It is included on my Garmin 45 map
datum listings (My GPS45 was bought in the UK).

You will find that instead of Lat/Long, it will give the Ordinance Survey
grid references. (I grew up on this and didn't know of anything else until
I moved to CA).

I also have a huge collection of OS maps of varying scales covering much of
the UK. Let me know where you are going to be and I'd be happy to loan
these to you for your trip.

Don't know about the 700 but the TH-D7 did not do to well in KISS. I just
got a D7E v2 (2nd version of the firmware) and it now works as it should.
The problem in Europe was that most nodes on 70cm use DAMA mode
and the TH-D7 did not support that either.
I got my D7 2 weeks ago and ran a few tests on 2m between my TH-D7
with TSTHost and TFKISS on a laptop one side and a PK-232MBX with
AGW and winpack on the desktop on the other and it works without a
glitch.
I haven't tried 9600 yet but suspect that won't be to much of a problem.

 Do you have a DC adapter for it or are you going straight in from the
terminals on the bottom? The DC adapter was the standard 12 vdc input
and it took about 350 mils peak transmit (with a full 13.8 VDC on it

it was good for near three watts)On receive it was about 80 mills
which isn't bad, but piggish next to the IC u2AT.

I have a 2AT here I bought for $50 used from N2DSY in the mid 80's and
was in packet service continuous digital service for over 10 years. I
still use it occasionally. Its deaf as a brick at this point but
attached to an RF brick with a preamp its fine. As a tracker you
should have no problem at all, its definitely a "set it and forget it"
item!

The best bet would be to download the manual in pdf format from Kenwood:

    http://216.98.255.24/Amateur/Instruction%20Manuals/

Then look at page Manual page 63 for dual band receive if you want the radio
to do VHF for packet and if you wish to transmit. Next check Manual page 79
for packet operation.

The V7A does have a data port that connects to the band on the left side of
the radio. I would suggest this, it was a snap to wire up and connect.

Scott

Jeff
You should get full power using 13.8vdc, 3 watts using 8.4vdc.
I used a ic-32at for a while that is similar

I've still got one of these good old radios around. I had to disconnect the touch tone pad, because it won't unkey properly any more, and I had to add a CTCSS deck in it, but with a big BP8S after market monster battery pack on board, I could easily work a public service event for 12-16 hours on a charge - both things you wouldn't be able to do with any of the current HTs I know of - but they all come with CTCSS now. Ah, the day of the radio you could actually work on.

Someone advised you to run the radio on 13.8 volts. Don't do it if you value the PA transistor! 13.8 would be OK for an IC-O2AT, ICO3AT, or an IC-O4AT (with LCD displays) but an IC2A, IC2AT IC3AT, or IC4AT (Icom's 1st handhelds) were designed for a maximum operating voltage right around 9 volts - the highest voltage battery pack for these radios from Icom was one holding 6 AA dry batteries, totaling 9 volts. The voltage rating on the final transistor is 12 volts, which with a 9-volt supply, provides some safety margin. Icom offered the DC-1 adapter, which was the same size as the stock BP-3 battery pack, which had a 7.5 volt (or so, it's a little foggy) regulator in it.

When that radio was in it's hey day I remember several folks on the air bemoaning the fact that they'd blown the final, and that Icom confirmed that running the radio direct from vehicle power was a mistake likely to damage the radio. It was sort of neat at that time - if Icom wasn't busy, and the repair was simple, you could wait at the walk-in service desk and they'd fix it while you wait.

Another caveat we learned about using the IC2AT on packet locally was that operating it on channels where there was voice traffic on an adjacent channel was a way to get the radio 'noticed' - the application of packet audio as the radio was being keyed slowed down the PLL lockup time. It's one of the things I suggested AEA add to their TNC code was a command to delay TX audio application for a settable time after application of PTT - to benefit the operator that was regularly keying up the area DX Club repeater with his pip-squeak HT from 20+ miles away. This was definitely exacerbated by the fact that the fellow using the radio ran the area PBBS! It solved the problem. I've not studied the Kantronics docs enough to see if they support this. This was over 10 years ago, and I hadn't really thought of it until dredging the memory banks about using the 2AT on packet again.

As for current drain, as I recall, the RX squelched current drain is about
20 mA, with the TX drain around 800 mA, with the DC-1 adapter. Of course,
your TX current drain mileage will vary depending on supply voltage. At
least these are low enough to be measured with a typical DMM.

If a watt or so is adequate, I'd get a 6-volt lead-acid alarm system backup
battery and use it to power both the TNC (assuming a KPC3+ or similar) and
radio, directly. In this circumstance, with a proper charging system, you
can even recharge off of vehicle power. 6-volts will also power many of
the GPS's out there.

  If you wanted significantly more power, then I'd add a small PA and run
it on its own 12-volt battery. This has the side benefit that if the PA
battery goes dead, the PA won't key up, but your station will still be on
the air at reduced power. The PA and its power arrangements could even be
in a separate enclosure, with a coax jumper connecting the two, so you only
use what you need for the tracker in question.

Hope that helps,

73, Bob

I found conflicting documentation for how to interpret the connection of
the send and recv data lines. Switch them, and see if that fixes your
problem. It fixed mine... The DB-9 diagram shown in the docs is a few
from the back of the connector if you are using a DB-9. This is how
I wired mine

        X W R X G

X X X X

X is unwired,
W is white wire
R is red wire
G is ground

Waiting for my call sign...

Scan speed of D700.

Was wondering if anybody could give me an estimate on how fast this rig
scans memory channels and how fast it does a search. Some of Kenwoods
prevous rigs have been slow as heck, like 1 channel per second. Like the
memory grouping and the scan edges that this rig has.

As you plan your summer trips, remember that there are 9 amateur
satellites you can use with your mobile FM rig and a whip antenna! From 7
to 12 AM and PM local sun time there is almost always one in view wherever
you are. Use them to communicate your position/status/messages or Email.
If you are traveling in remote areas, plan on taking advantage of them!

Three are FM voice.
Three are BBS's, with message store and forward
Three are live DIGIpeaters at 1200 baud needing only a laptop (no TNC) to
      send back E-MAIL and/or status/messages to a WEB page
Two maybe live two-way digipeaters for live QSOs and TEXT messaging

We hope traveler communications from all will be available via WEB pages.
To serve these travelers, we also need volunteer ground stations too...
You can even do it with an HT and a handheld antenna!

See http://web.usna.navy.mil/~bruninga/astars.html
or join aprssat@lists.tapr.org and tell us you are new so we can fill you
in on the details.

de WB4APR, Bob

Im planning to take my THD7E to chicago later this week. What are the
suggested settings/frequencies so I dont look too english when I get
there?

Hi Carl

Set it to 144.390 for APRS and you should see a lot of activity.

Have fun

144.39 for APRS activity. Also try 442.800(+5) PL 114.8 for voice
activity. Lot of APRS users on that repeater. The repeater is 10 miles
or so NW of Ohare. What part of Chicago are you going to?

144.39 MHz everywhere.
Set PATH to RELAY,WIDE,WIDE (or less)
That should do it...

Rendered body type: text/plain

Hi all,

I am back from my trip to upstate New York. Sorry my schedule didn't work out for meeting anyone. I arrived in Albany on Sunday night around 11:45 PM. Then I drove to Williamstown, MA where I was staying. Nice drive and nice country as I saw today on the way back!

Anyhow, I made a few calls on some of the repeaters including the 444.000 machine someone recommended. No one came back.

What really disappointed me was that I heard hardly any APRS traffic even when in Albany. While sitting at the airport this afternoon I was able to see that a couple of my packets went out onto the local network but I didn't hear anyone else. I heard a couple of squelch breaks when I was on the top of the mountain pass between NY and MA but that was it. Perhaps it was the fact that I was just using a duck on the HT inside the car. It wasn't the standard duck, but a longer high-gain one from Comet. Don't know if anyone saw me or if I made it in anywhere or not. I guess next time I'll have to throw a mag mount into the luggage.

So no good APRS stories for me. Oh well......seems the only place where I really had any APRS success was in the LA area last June. All my other travels end up with me not hearing much at all.

Web controlled TH-D7 update:

I have made the interface a bit more user friendly. I also added a few more
functions like scan, and it is now able to change between bands. You still
need to use Netmeeting and Internet Explorer to view and control the radio.
Only one visitor is able to hear/see the TH-D7 at a time.

I have one and I've tested it. It works for a tracker just fine. It took
about 1 hour to put together. If you are looking for more specific details,
ask me.

51. [htaprs] Palm Pilot help

From: Glenn Cummings <kg7il@foxinternet.net>
Date: Wed, 10 May 2000 18:55:43 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-83054-2000.05.10-20.58.09--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am considering a Palm Pilot (Probably the IIIxe)
  I have 3 programs that I wish to Run
    1. DeLorme's Solus software for Mapping and GPS
    2. VT100, or other terminal emulator for packet BBS and Email
    3. Pocket APRS (?) I am not sure what APRS software runs on it.

I have a Kenwood TH-D7A, Garmin 45XL, Tripmate GPS....and plenty of cable
building experience.....

  My Questions:
    Q-A. Is there other options(h/w, s/w, cables) that I need to get with
the Palm Pilot to load software ?
    Q-B. Is there a full-kit / package that includes what I need?
    Q-C. What cables do I need for my Garmin GPS.... I have pfranc Purple
connectors don't know what the Palm requires
    Q-D. Is there some good introductory Web sites.
    Q-E. What APRS software is available for the Palm and what are their
strengths.

The Palm Pilot is new to me, Any helpful pointers or links would be
appreciated.

I used one of these for a tracker. It was easy to build and fun to
experiment with. I want to put the next one in a project box with the
lights on the outside. The GPS I used was the $20 from Mavin. I wish I
could get one more of them, but they are out. I am giving these cheap
trackers to friends to use to get interested in APRS. I know a few
people bought them to only use the antenna and did not use the engine.
Does anyone have one they want to resell?

My experience is with the Palm IIIx and the D700, but much of it applies to
the D7, as well. Others can help you with the particulars of the D7.

The Palm comes with a hot-sync cradle that will interface to your PC to
download software to your Palm. (It is rs232 and plugs into the pc)

> Q-B. Is there a full-kit / package that includes what I need?

No...and you don't really need a full-kit or package, but you can buy all
the pieces.

> Q-C. What cables do I need for my Garmin GPS.... I have pfranc
Purple
> connectors don't know what the Palm requires

The serial connector for the gps is the Purple you have. It needs to be
wired to the gps in/out of the D7. On the D700 it is a 3/32 sub-mini male
plug. Three wires...in, out, gnd. I think the d7 uses the same plug...but be
sure to check..it will be provided with the D7.

I don't know how the serial interface for the D7 is handled for its tnc. The
D700 uses a standard DB-9 for using the D700 in "standard tnc" mode with a
palm. It requires a hot-sync cable and a null modem adapter. The D7 is
certainly different, you need to check with a D7 owner.
>   Q-D. Is there some good introductory Web sites.

http://www.pocketaprs.com/wiring.html

http://www.pocketaprs.com/   (web site for pocketaprs software
description and hints)

ftp://ftp.tapr.org//aprssig/palmstuff/palmaprs/pcktaprs.zip

(location of the pocketAPRS program...it isn't called palmAPRS any
more...copywrite issue)

ftp://ftp.tapr.org//aprssig/palmstuff/palmmaps/

(location of maps for the pocketAPRS program for the palm.

>   Q-E. What APRS software is available for the Palm and what are their
> strengths.

The bad news is there is only one, pocketAPRS by Mike Musick. The GOOD news
is that it is a TERRIFIC program. It is stable, well written, feature rich
and quite easy and intuitive to use. You're gonna love it!

>
> The Palm Pilot is new to me, Any helpful pointers or links would be
> appreciated.

I am copying a general information message to you under separate mailing
that addresses a bunch of the issues you raised. It is from Mike Musick,
author of pocketAPRS.

Hope this helps ya. 73

Hello,

I was taking stuff in from the car when my 1 month old Kenwood TH-D7A slipped
from my grasp and landed on the linoleum in the kitchen. The battery
separated from the rig and I heard a piece of something fly off. The battery
and radio were lying on the floor.

It seems the rig must have hit on the encoder knob as that was the piece that
flew off. The control shaft broke. It looks like it was plastic.
Interesting that the volume control part appears to be metal.

Is it common for this encoder shaft to break? Is it possible to get Kenwood
to fix it under warranty? If not, is it possible to glue the shaft back on?
Can I get the service manual and parts? This would have to occur before I
go out to Dayton 8-<.

Hi Eric,

IMHO, there is no way you are going to get that thing
into Kenwood and back by Dayton..
Also, I would suggest you go with it as is... You only
indicated that the control shaft broke. That means you
can still control everything with the "rocker"
joystick, right? Can you still control the volume? If
yes, then you can wait til you get back from Dayton to
have it repaired.
I wouldn't be surprised if Kenwood would charge you too
much for repairs.. Talk to Kenwood at Dayton.. In the
meantime, have fun, it could have been worse!!

Robbie

Ditto

>   3. Pocket APRS (?) I am not sure what APRS software runs on it.

Played with it a little (not much room in 2MB!)

>   My Questions:
>   Q-A. Is there other options(h/w, s/w, cables) that I need to get with
> the Palm Pilot to load software ?

No. The pilot comes with all the cabling necessary to sync data and
programs between the main PC and the PDA. This has been one of its
strengths since the original USR Palm 128.

>   Q-B. Is there a full-kit / package that includes what I need?

You will probably want one of the travel kits to get a cradleless serial
connector, null modem cables/adaptors to connect to GPS or TNC.

I can comment on Solus, VT100.

I've used two general purpose map+GPS programs, QuoVadis (marcosoft) and
Solus.

QuoVadis is cheaper, maps are VERY detailed albeit simpler line drawings.
They are organized by city/county/state so you can grab data for a
location you frequent ahead of time. Data can be searched (intersections,
roads, some landmarks/place names). Scalable display. No network
connection needed. Easily configured to work with different GPS units.

Solus costs a bit more, it is optimized for DeLorme's own hardware (I have
to reconfig it each time I use it for my NMEA output GPS receiver. It is
really intended to load maps and directions for a specific trip. The maps
are detailed close-in to the destination and become quite limited enroute.
Directions are OK but subject to limits of computer generated directions
(no local knowledge). Since directions are generated one pair of
addresses at a time and downloaded, you need a web connection and a PC.
Only Windows is supported, they did not admit to plans to support MAcs or
Linux when I asked.

OTOH, the graphics of its maps are better than QuoVadis'.

VT100 is a nice telnet terminal program. I've used it for simple packet
radio work with a KPC3 and HT.

GPS/maps programs like to leave the pilot running. This eats batteries.

Maps take up lots of room. Get an 8MB unit and consider software that
lets you store static content (maps) into flash rom.

Yes, especially if you are leaving next tuesday. Overnight
saturday delivery, guy works on it Sunday/Monday, out Monday
afternoon overnight to Boston. No, I do not think so 8->.

I stared at the unit and wondered how I could just get the APRS
frequency. Then I remember the rocker pad. I will wait

until I get back but this is one more thing to take care of!

Volume is okay. In fact I took the back cover off. Interesting
how it disassembles. The volume/encoder is a single unit that
plugs into the circuit board. The plug on the circuit board is a
right angle one so the volume/encoder slides in parallel to the
circuit board. A metal bracket keeps it from lifting away from
the circuit board. So it looks like someone realized the volume/encoder
units may break.

It is interesting that the antenna did not "break" the fall.
The unit must have hit just right on the side of the encoder knob and
broke the encoder shaft clean off.

> I wouldn't be surprised if Kenwood would charge you too
> much for repairs.. Talk to Kenwood at Dayton.. In the
> meantime, have fun, it could have been worse!!

Yeah, it could have stopped working. I will talk to them
at dayton. Maybe I will get a cap to put over the volume
control and not fix the encoder at all. It would just break again.

Hello from Pete, KD4SPW in Ft. Pierce, Fl.

      I have dropped my D7A several times. I have been lucky so far. One time
it fell from a card table to the concrete driveway. It must have landed on or
against the tuning/volume knob. The shaft is now bent, I suppose as the knob
sits cock-eyed a bit. It is no longer perfectly vertical.
      My new concern is the antenna connector. I haven't heard of anyone with
my new problem. With all the past sig posts about the vulnerability of the
sma connector, I placed a rubber o-ring between the slim duck antenna and the
radio. I had noticed before that receive signals could drop if antenna
either to loose or too tight.
The o-ring seemed the perfect solution as I could snug it down quite well and
be assured of a good connection.
       But recently when I started to remove the duck to install it in my
truck, the sma connector started backing out of the HT along with the
antenna. Luckily I noticed it right away and screwed it back. So far I have
been too chicken to attempt to remove it again and have only been using it
with the duck antenna.

        BE CAREFUL WITH THE SMA CONNECTOR !!!!

Bye from Pete, KD4SPW.

Most dissapointing. When I bought my first HT, a Yaesu FT-11, one of the
selling points was a Yaesu rep pulling one of his belt, removing the
battery pack AND CHUCKING IT across the showroom of the Phoenix HRO store.
He was very confident that it wouldn't hurt the unit. And it didn't. The
durabilty of mine was tested by taking a flying leap out of a jeep going
about 25 MPH and skittering down the road for about 50 feet before it was
stopped by ramming into a curb. The only damage was a scuffed bottom
corner where the soft case abraded away whilst sliding on the asphalt. A
few days later I put it on a service monitor, and everything tested OK.

I can't tell you how many times I sat on that radio or smacked it into door
jambs. I even closed the door of my convertible LeBaron on the antenna,
putting a permanent kink in it.   I sold the unit to my (now) landlord, and
he still has it, and it works great.

I replaced it with an FT-51, and although I babied it more than the FT-11,
it still took and survived a few good shots. Both survived being baked in
parked cars in Phoenix, and both were regularly taken on multi-day
backpacking trips.

I hope I never stand up in a jeep at speed, forgetting there's a D7 in my
lap...

Rendered body type: text/plain

Kenwood offers free programming software for the TM-G707A Transceiver
on their website. You connect a computer to the rig via a PS-4S program
cable. One end is a mini Din connector and the computer side is a DB25
or DB9 via adapter. Kenwood won't share the pinouts for this cable if
you want to make one on your own instead of buying the costly PS-4S.
Anyone have the connection arrangements? I ran into a similar problem
with the TM-700 connector. You can buy a mini Din connector at RS and
make your own cables instead of buying the factory units. At least
Kenwood gives the pinout configuration.

Part of Kenwoods testing procedure for a portable should include drop
testing at least from a height of 3 or 4 ft. Any manufacturer of radios
should realize that radios (especially portables) will get dropped from
time to time. A drop like that should not cause any permanant damage.
I would have to believe Kenwood would stand behind their product. No if
you dropped it off your tower 50 feet, that would be different. Let us
know what they say. Their response may affect whether or not I look at
Kenwood for my next radio.

SMA connectors, by design, should be tightened to exactly 8-in/oz of
torque. Any looser than that and the center pin doesn't make enough
contact. Any tighter, and you risk damaging the threads. Without using a
standard 5/16" 8-in/oz torque wrench (rather hard with most rubber ducks),
a good rule of thumb is handtight and an additional 1/4-turn.

Well, at least give KW credit in making the encoder a plug-in rather than
soldering it to the PCB. That was additional cost on their end, but now you
can just order the replacement part and pop it in yourself.

I wonder what a new encoder costs? We're using an encoder on the hamhud
boards, but it's not as small and sexy. Still for $2.50 it's a great deal.

I use a D7 and D700 with Garmin 12XL and a Pharos GPS's and a PalmIII. I
like PocketAPRS a lot.I added an 8M expansion to my PalmIII so I wouldn't
run out of map room. The D7 and D700 use the same mini plug for the GPS but
for PC connection, the D700 uses a DB9 while the D7 uses a mini plug. I

wired two mini plugs with different gender DB9's for the D7 so I can connect
the GPS and PC/Palm to the DT at the same time. You might want to invest in
a Radio Shack DB9 gender changer and null modem adapter for one of those
unexpected combinations..

I don't know if it's /common/, but it's sure not hard - about three months
after I got my D7, I had it in a pocket of my windbreaker, with the antenna
off, pointing down, hanging on a cubicle hook over a carpeted floor. So
basically, it was about 2-3 feet over a carpeted floor. Anyway, the jacket
fell off and it hit the floor and SNAP. The encoder shaft is pretty
lightweight metal, it looks like brass.

As for gluing it, unless you can find something that binds that type of
metal, and can apply it very carefully, I wouldn't attempt it.

I have never bothered to fix mine - there are no functions at all it served
that can't be performed easier and faster elsewhere, and I figured if it
breaks that easily, it'll probably just happen again at some point anyway.

Hello,

Well I cannot find the knob with the rest of the shaft. The broken end in
the encoder looks like it is plastic.

It looks like it got the antenna connector as well. I was removing the
antenna and the "metal" threaded shell came off with the antenna. This

is a metalized plastic. Fortunely I can stick it on with the antenna
and it does not flop around much.

So I guess it is back to Kenwood. I suppose I need to get an RMA and
ship it off to the West Coast after Dayton. Maybe I will go over to
the web site and give some feedback.

73. [htaprs] MIC-E to NMEA-Converter

From: "K.Hirschelmann" <k.hirschelmann@mainz.netsurf.de>
Date: Sat, 13 May 2000 15:02:15 +0000
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-83547-2000.05.13-08.05.35--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello,
in case somebody is interested in using MIC-E-Format-Messages (like
being send from TH-D7, PIC-E, MIC-E or Tinytrak) for evaluation with
Standard-NMEA-MAP-Programs (like e.g. FUGAWI, GPSS, WINGPS or those for
organizers), then he should try my simple "MICENMEA"-Converter.

More Info can be found here : http://www.kh-gps.de/micenmea.htm

The Kenwood TM-D700 is said to deliver a slightly different
MIC-E-Protocol. Future versions of "MICENMEA" are planned to cover also
signals being send from this type of radio.

I am looking for Beta-Testers

I've had my D700 a few weeks, and am finally getting the hang of most
functions.

I have one question: Is there any benefit to running 9600 baud on the GPS? I
don't see any, I was just wondering if there is anything that I can't think
of..

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

Has anyone talked to the VC-H1 through the mostly undocumented com port?

I've been able to read out my callsign, and get it to change modes
(damifino to what mode!) and to transmit.

115200, 8n1 or 7E1, I'm not sure which is really correct yet.

The reason you would run 9600 on the NMEA port is IF (and only IF)
you had a GPS that output 9600.. Some of the fancier ones have this
option. Also so do some of the OEM units.. Most consumer units do
not, therefore, it isin't much use to MOST people.. But it is a very
nice feature to have, IF you need it..

79. [htaprs] re:Info on Packet operation

From: Glenn Cummings <kg7il@foxinternet.net>
Date: Sun, 14 May 2000 13:19:10 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-83843-2000.05.14-15.22.18--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

First get on a frequency that has packet data. A good one to start with
to
ensure that you are receiving well would be the APRS data frequency of
144.39.
Turn you radio on, and with that simplex frequency set up in Band A,
listen for
a while. You should hear some packet bursts.

This accomplishes nothing more than ensuring that you have an 'active'
frequency
to receive data..

Now Set your Data Band to A, [Manual page 55] and DCD Sense as shown.

Assuming you have it cabled correctly and hooked up to your PC, turn
your volume
up about 1/3 to 1/2 volume, set your squelch until it is just quieted.
Start
your packet program or the hyperterminal that comes with Windows.
[Step 1 on page 54]

If you don't have a packet program, you may need to go back and install
it. On
Windows 98 this is: Start / Settings / Control Panel / Add Remove
Programs /
Windows Setup / Communications Hyperterminal.   You'll most likely need
your
Windows Disk. If you do have a packet program, it might need a few
settings
changed for the D7.

With your terminal program running, set your comport and settings to
9600, 8bit,
1 stop, parity none with XON/OFF flow [Step 2] This can be in various
places
depending on what terminal program you are running.

Push your TNC button twice to get in the Packet mode [Steps 3 and 4].
You
should get a banner from the D7 on your terminal screen. This is the
TNC boot
messages. If you didn't, try turning the D7 back off. Save your
Terminal
settings and restart your terminal program. This may not be necessary,
but
depending on you terminal program, it might be. You should get your TNC
boot
message when you turn the D7 back on.

Once you have communications from your terminal program to your TH-D7,
try

entering MYCALL xxxxx , where xxxxx is your ham call.

You should get a response from the D7 acknowledging this change. Now
sit and
wait for some packet bursts to come in. You should get a cryptic, APRS
string
displayed on your terminal.   If all this goes well, you are ready for
packet.....

However, you must find an active frequency in your area....
Once you do, set it up as above and let it 'listen' for a while, you
should see
some call signs, and node names displayed on your screen.. This mode is
command
mode and should display all incoming packets.

I'll try to find a good tutorial link on the general use of packet using
a
'dumb' terminal program like hyperterminal, but this should get you
started
debugging until then.

A good start for general packet information is
http://www.tapr.org/tapr/html/pktf.html

I didn't find a simple or helpful page that describes your first "hello world"
connection. Maybe someone else is aware of a good, simple, description of a
connect. If not, perhaps I can to a text save from one of my connections.

You can connect to other hams and chat keyboard to keyboard.
You can also connect to a BBS node and read/send mail and read Bulletin Board
System messages.

It's easy to read the packet data to determine what stations might be close
enough to connect.
Sometimes you can also 'watch' someone else connecting to a BBS node and pick
out it's name in the data string.
(For me, I have a nearby SEA node for the Seattle BBS system)

Tune to 144.39 anywhere an monitor for 30 minutes. If you see no one,
then you are in an APRS dead zone.

ANYWHERE on the planet, however, you get access to 9600 baud packet data
whenever one of the 9600 baud satellites flies over. WIth 5 birds
donwlinking at 9600 baud, this is about 15 passes a day... WIth the HT,
you cannot transmit to any of these birds, but they sure do give nice 9600
baud test signals...

Rendered body type: text/plain

Hi,

I have two issues:
1. Is it true that you can't send IGate messages with WinAPRS
    before you register the program? If so, is there any other software that
    will enable me to do that that is free?
2. Has anyone successfully operated TH-D7 in the KISS mode?
    My goal is to have my KPC9612+ on one end of the radio link and
    TH-D7 on the other in order to provide me with wireless internet connection.
    I would run both on 9600 baud UHF. All I know so far is that somehow
    I will have to be involved with TCPIP. I will have permanent internet connection
    on the KPC9612+ side, at home. My TH-D7 will be connected to my laptop.
    I would like to be able to go around and check my email with that laptop through
    the TH-D7. Would web browsing be possible? I imagine it would be slow
    but I would still be happy to get it working.
    So I have hardware in place and if you folks could fill me in on what software
    I need for this that would be great.

Thanks to all.

On Sun, 14 May 2000, Glenn Cummings wrote:

> What are some frequencies for the satellites?

That is why I wrote APRStk. It integrates satellite tracking into APRS so
you can do both. In APRStk, just hit LIST-FREQS and it shows you their
freqs. If you ar connecte to a D7 or D700, APRStk will auto-tune the
radio and so you wont miss an passes. Just set the squelch and APRStk
will tune the radio whenever a satellite is in view...

Here are the ones:

UO22 = 435.120
KO23 = 435.170
KO25 = 436.5
TO31 = 436.925
SO35 = 145.825 (not always on)
AO27 = 436.8   voice
UO14 = 435.07 voice

See all about it

Rendered body type: text/plain

Can anyone give us a detail of the local Dayton APRS network?
I will "assume" that the locals will install a "WIDE" within HT range of
the HARA arena. In this case then I would think that the following might
be a "travelers" recommendation?..

ENROUTE
1) Begin with whats appropriate in your area
2) Transition to RELAY,WIDE,WIDE as you enter unknown territority
3) When you get within 30 miles of the HAMVENTION, shift to WIDE,WIDE

If you pass through open areas with little/no APRS coverage consider
enabling UIDIGI ON, RELAY in your D700 mobile. BUT YOU MUST REMEMBER TO
TURN THIS OFF LATER when you get within 10 miles of the ARENA.

*** CAUTION **** I have discovered the following and if anyone else can
confirm this result, we need to get the word out...

*** If you EVER enter anything more than RELAY in your UIDIGI list in the
D700, such as RELAY,WIDE, then you MUST remember that simply changing it
back to just UIDIGI ON, RELAY does not appear to cancel the WIDE!. The
only way (I have found yet) is to change it to UIDIGI ON,RELAY,XXXX.

The XXXX will overwrite the internal TNC's rememberance of WIDE and thus
you wont continue to digi WIDE packets. If you do NOT do this, you will
be a VERY unpopular mobile WIDE forever...

Can anyone else confirm this. Or tell me how to get the TNC to forget the
"WIDE"?...(Im talking APRS mode here. Its OK in PACKET mode)...

89. [htaprs] OBJECTS on the D700 & D7

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 14 May 2000 20:01:07 -0400 (EDT)
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-83878-2000.05.14-19.03.35--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

One thing I would like to see more use of is OBJECTS from mobile D7 and
D700 operators reporting traffic conditions. Especially when we are all
enroute to Dayton. This is EASY to do for objects you pass on the
highway... (and to alert those behind you)...

Simply go to MENU, MYCALL and enter the name of the object. THen Hit BCON
a few tiems to tramsint. Once you see MYPOS to indicate that it was
digipeated, then restore MYCALL to your own call. Everyone within range
of you will see the traffic condition pop up on their LISTS, showing
their distance and direction to the problem. Great for route diversion.

NOTES:

1) EXAMPLES: TRFFC, COPS, WRECK, FIRE, CONST, DETOUR, FLOOD, RAIN
2) Remember there can only be one such named OBJECT in the area at a time,
so if someone has already posted one, then you may need to use a
different SSID to make yours unique.
3) These are one-time OBJECTS only, so they will slowly be bumped off
everyone's list.
4) Since the object used your vehicle as the POSIT reference, it will use
your ICON and CSE/SPD. THis is OK, but if you wanted to take the time,
you could also change the ICON. I wouild receommend the TRIANGLE ICON for
such traffic objects as first guess.

A good way to pass the driving hours to/from Dayton!

Rendered body type: text/plain

Thank you for the pointers. Yes, that particular model has the TNC built in.
There is no way I can reverse the leads. I have been able to get my tnc to
communicate with the PC using the Hyperterminal supplied with Windows. I
have been able to get the command function on my PC and have issued some
commands to the tnc successfully. But when I try to connect with a station
(Can't figure out how to do a general CQ to see if there are any packet
stations availible.) I get no response. The tnc transmits and my scanner
picks up the fact that it is, but I get no response back.

Any more suggestions?

I think that the previous note was referring to the leads on your
interconnecting cable.
But since the terminal program and the D7 are communicating, that's probably
not the problem.

Ideas....
1.) To CQ, Set Beacon to a frequent value and set Btext to your CQ message

     frequent depends on the activity on the channel. If the activity is

light, every 30 seconds may be fine. If the problem is on your end,
and if there is a lot of activity, it could be annoying to holler CQ
every 5 seconds and and not be able to answer. Turn it off after a
connect (go to cmd mode [ctl-c], and BT Every 0, and return to CONV)

2.) Do you get APRS data on 144.39? If so, try contacting a nearby ham and see
if you can arrange some connect time.

On APRS, set you lat/lon and see who is in radio-shot using the
distance direction as a guide.. Use http://www.qrz.com or any call
look up. Lot's of us list our e-mail address. Work 'em on simplex
voice first to ensure a good path. When you line up some help, having
a phone or a second radio handy makes it easier to work out the
connection.

Let us know how it progresses.

Rendered body type: text/plain

I am running my D7 with a Garmin GPSIII+ while mobile. How do I get my D7's
status text to appear on maps.findu.com or maps.aprs.net websites? Other
stations seem to be able to do this. I have position, course, and speed
getting through, but no status (or position comments...but I don't see these
for other stations either). I definitely have text in the status entry area
of the D7. Is there something I'm doing wrong?

Not sure exactly how this relates to the Kenwood radios, as I don't have
any yet, but generally, STATUS packets need to start with a ">". For example:

>Hello World! de Mike <mdobbs@amgen.com>

Message-ID: <LYR845-84166-2000.05.15-21.36.49--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Since HALF the fun for APRS is the fun of operating while driving to
Dayton, here is an idea to expand your horizons while you are out in the
boonies *and* have run out of local APRS QSO's...

If you use the MESSAGE GROUP of "DAYTON" then anyone else with the same
MESSAGE GROUP can share short messages. To send to this message group use
something like the following:

TO: DAYTON
MSG TEXT: CQ Enroute Dayton, now passing through Omaha

Now, this normally will go ONLY locally! BUT! it WILL go back to RF via
any IGate anywhere that has "heard" from any station with the CALL of
DAYTON.   To SEED your local IGate into thinking that there is a DAYTON
in your area, simply change MYCALL to DAYTON and send out a few packets
until you see at least one of them digipeated. At that point,
the IGate should ADD DAYTON to its local list for the next half hour or
so and now it will forward to your area any other messages addressed to
DAYTON.

To be legal, your STATUS text should contain DE YOUR_CALL since
you are using a "tactical" call of DAYTON temporarily.

Now, having seeded the local IGATE, return MYCALL to your own call and
simply watch your MESSAGEC list for anyone else using the DAYTON message
GROUP. Oh yes, of course, to see these, you must add DAYTON to yur APRS
MENU MESSAGE GROUP list (or just add the wildcard "*").

Now like anything else, DONT abuse this and THINK about what you are
doing.

1) Dont do this if you already have enough people to QSO via the RF
digis in your area. THis is only for those isolated with no one else to
play with.

2) Once you find someone to QSO even if across country, then stop using
the DAYTON MESSAGE group and change to HIS call directly to minimize QRM
everywhere else in the USA.

3) Avoid rush hours. THis is a play thing and dont let it add QRM to
rushhour traffic...

Enjoy!

De WB4APR

Hi Bojan,

> 2. Has anyone successfully operated TH-D7 in the KISS mode?

I bought a TH-D7E a few weeks ago. However, it's not the old version but
the new 'revision 2'. This revision was done by KW because of the many
complaints (especially by European hams) that the TH-D7 did not work in
KISS and did not support DAMA (which is widely used over here).
I waited for version 2 of the TH-D7E and it works great with TFKISS on
1200 and 9600.

I recently purchased an TH-D7A. I am still waiting for my call sign
assignment from the FCC, so I haven't been able to personally operate with it.
 However, I have encountered a frightening behavior where by some APRS packets
are crashing the radio and causing it to lockup. Worse than that, there
appears to be portions of the configuration memory that is becoming
overwritten.

Has anyone else experienced such behaviors?

The SN is 01200040. I do not know how to tell if this is a newer version
(I've had it for 2 weeks) or an older version.

Rendered body type: text/plain

Having gone more than a year without any lock-up problem on my TH-D7A S/N.01000087 I
thought I had lucked out.

However, now it's really locked up. I was receiving APRS with my Garmin 45xl hooked up
to it.
Now the keypad is locked up. I tried holding the [F] and powering on as described on
page 32 of the manual. It just comes up in it's locked mode. Encoder changes the VFO,

but nothing else seems to have any effect.

I have held down the power + [F] key as I slide the battery on, and all I get is the
LED/LCD test, that is all segments of the LCD are lit (blackened) and the two LED on top
glow orange. No reset options offered, stays locked in the test mode.

I searched previous messages, found a lot of lock up problems but didn't find anything
like this.
Did I miss any relevant message? Any ideas?

104. [htaprs] TM-D700A as digipeater, how?

From: "Stan Slonkosky" <ke6zc@earthlink.net>
Date: Tue, 16 May 2000 23:39:20 -0700
To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-84427-2000.05.17-01.40.10--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have both a TH-D7A and a TM-D700A. I want to use the D700 as a digipeater
as I take some short hikes from my pickup truck with the D7. (Today I was at
Petrified Forest Nat'l Monument.)

According to the Specialized Communications manual for the D700, p. 27, all
I need do is turn the digipeater on and make sure that UIDIGI is set to
"RELAY" or "WIDE.". I tried both with no success. The D7 and the D700
communicate with each other fine. The D700, with a 1/2 wave mag mount
antenna, was able to hear plenty of stations from Phoenix, Albuquerque and
other places that the D7, with an antenna only a few inches long (Comet
SMA503), could not receive. I had hoped to use the digipeat function in the
D700 to enable those stations to be repeated to the D7. PACKET PATH on the
D7 is set to "RELAY, WIDE".

What am I doing wrong?

TM-D700A is KE6ZC-8
TH-D7A is KE6ZC-7

To: "TAPR Hot Technology APRS" <htaprs@lists.tapr.org>
Message-ID: <LYR845-84483-2000.05.17-07.35.19--lyris.htaprs#tapr.org@lists.tapr.org>
Rendered body type: text/plain

over the last two years that i have had the origional version th-d7 i
have noticed that if i go from a dc power supplly, to the battery pack and
try to activate aprs it will lock up.

if i go from a car power supply, to a bench power supply and try to activate
aprs, it will lock up the keypad, or lock up in aprs xmit mode.

it for sure must be depedent on the voltage of the power supply source. i
have tried all sorts of dc sources, some with the same voltage and purity of
dc and it seems to go wacko just because i change supplys, even if they are
the same exact voltage.

i have to really watch it, because if its sunny, and i activate aprs, i have
to make sure when i boot up that it does not stick in xmit mode.

i discovered this problem a long time ago, and have lived and worked around
it.

i always use the kenwood cigarette adapter, but it does not seem to have
anything to do with filtering.

when it locks up the only thing to do is remove the battery pack.

Are you turning the rig on and off before changing power supplies? If not,
you probably should. In the process of plugging in a DC supply while the
power to the radio is "on" you may end up getting some funky voltage spikes
or ground currents or something. That could cause the lockup. If you turn
off the radio when changing from battery to a DC supply, and then turn it
back on again, you should have no problem.

73,

Jon

Even set to WIDE, it will not digipeat ANY packet unless there is an
"unused" WIDE still available in the path. If the packets you were
hearing are WIDEn-N, or WIDE*, then they wont get digipeaterd...

Try using the cross-band repeater function to hop the 144.39 traffic up to an
available 70cm channel.

Hi Jon. When the battery pack on my D7 dies, the D7 starts to beep, beep
(feed me, feed me) and it will not turn off. Apparently there is not enough
power to operate the shut off circuitry. I have two choices, remove the
battery pack or plug it in to an external source. Obviously, while zipping
down the freeway, the safest choice is to plug it into the vehicle power
system. I have never had a lockup.

Worse than that, when in beacon mode, the D7 will attempt to beacon, get
halfway into the transmission, get a voltage sag at the battery, reboot,
and then attempt to beacon again. (Beebeep, transmit, beebeep,
transmit, beebeep, transmit...)

I've heard many D7's flooding the airwaves with battery dying beacon
qrm. So I don't feel so bad when mine does it, now. Still, it's

embarrassing, and abusive of the bandwidth.

Yet another bug. A correct implementation would default the beacon
timer on start up to wait the full beacon delay period before the first
beacon.

Rendered body type: text/plain

Hi,

I would like to know how exactly does the TRACEn-n and WIDEn-N work.
I know that every time a wide passes on a packet with WIDEn-N it subtracts
1 from the big "N" . But what happens when "N" becomes zero and "n" is
say 2 or 3. What is that little "n" for?
Can you use TRACEn-N with the D7? How is TRACE different than WIDE?
And my last question, where can I get the advanced manual for the
TH-D7A (for packet and APRS)? Is there maybe a copy of it online?
Thanks!
Bojan,
KF6OUC

Why do you run it off battery while in the car then anyhow? If you have
external power available then why not run that all the time?

But you are correct. It is an annoying feature of the TH-D7A that when the
batteries begin to run low, that it keeps power cycling. Poor design in the
power/voltage monitor circuitry IMHO.

The short answer is that 'n' is a note to those who might care of the number
of hops that the originator of the packet wanted it to take. Now, nothing
says that you can't originate a packet with WIDE3-2 or WIDE3-1 to reduce the
hops from the onset.

If you read the APRS spec, version 101m, the section on WIDEn-N is brief and
alludes to no explicit meaning of 'n' for values less than 8. The higher
numbered values (8 and up) have directional indications for some form of
routing. But, I have heard that no one is using 'n' >= 8 for anything special
in existing TNCs or TNC software.

It would be nice if TNCs understood 'n' to be unique so that you could use
some value of 'n' locally to indicate special routing. But apparently, a
WIDEn digi will swallow and then spew out any WIDEn routed packet if 'N' does
not become 0 when it is processing it...

I am flabbergasted at the answers everyone has given Stan ... re-read
his message ... he only set the UIDIGI, he did not page through the
rest of the menu and set DIGIPEATER ON ... it is not that difficult to
miss when you consider that the menu choices are poorly (IMHO)
grouped.

Rendered body type: text/plain

Hi all,

I just bought one Garmin Etrex GPS and I connected
it to the D7. It appears like the D7 is still transmitting the location
which was put in the MY POSITION menu.
I do have the Etrex set for NMEA out 4800.
My D7 has GPS enabled.
I even tried putting the null modem between the two and it still doesn't
work.
What could be the problem?

Regards,
Bojan

Rendered body type: text/plain

What does the D7 show when you press the POS button on the keypad? If you
are correctly connected to the GPS, while waiting for a "lock" between the
radio and GPS, you should see the degree symbols flashing. When a lock is
made, you will then see your coordinates and you will hear a small 3
syllable beep.

Also, FYI, the radio will not get a position from the GPS unless you have
the TNC turned on. Make sure the TNC is on, but not in Packet mode. Once
you have the TNC enabled, try the POS button and see if you are getting a
fix from the GPS.

And do make sure that the radio is set to NMEA under the GPS UNIT menu
command (2-2).

Let me know if that still does not do it.

Thanks for all of your help. Got it working!
It was a grounding problem. One cable had
the ground connected to the shield only and not the pin # .
Thanks to all for walking me through the troubleshooting
process.

Is it possible to use the USB port on my laptop to recieve the input from my D7 instead of the 9-pin
serial port. If so, does anyone know how to construct the necessary cable, or have schematics for it.
The laptop I want to use is a Sony VAIO supeslim, that needs a port replicator to use the serial port,
but has a USB port on the actual frame of the computer. It would definitely make mobile use easier.

Thanks, and 73!
KD7FGG.

Funny, I was just considering the same thing for my new VAIO. I've been
looking and you can get USB to Serial converters from several vendors.
Some are bulky boxes but there are a couple that are simply a cable with
USB on one end and a slightly bulky (housing the electronics) DB9 on the
other. Most are $50-60.

There are also PC card to serial devices too but I haven't tracked any
down to price them.

The other option is to whack the cable off the port replicator, guess
which pins are the serial port and put a DB9 on it. Unfortunately that
isn't so cheap or easy. But the port replicator is pretty lame anyway.

Good luck!

You would need an serial to USB converter.   If you are running Win98 (and
maybe Win2000) it should work.   Converters run about $50 I think and
available from several vendors including Belkin.

  Subject: [htaprs] USB cable?

  Is it possible to use the USB port on my laptop to recieve the input from
my D7 instead of the 9-pin serial port. If so, does anyone know how to
construct the necessary cable, or have schematics for it. The laptop I want
to use is a Sony VAIO supeslim, that needs a port replicator to use the
serial port, but has a USB port on the actual frame of the computer. It
would definitely make mobile use easier.

  Thanks, and 73!
  KD7FGG.

Right. Except that you would want to express the two examples above as
WIDE2-2 and WIDE1-1 to show the receiving station how many hops you started
with.

Except in the case where you wanted to suggest a longer path might be
necessary to reach you...

Yes!!!

Go to http://www.entrega.com (actually they are owned by Xircom now but
the page will redirect you).

They have a nice USB to 9 pin serial cable. It really helped me clean up
my mobile installation as I too had to have a port replicator on my Toshiba
Portege in order to get a serial port.

OK, so what is the difference between WIDE and TRACE?

Sounds fine to me, Greg, as long as we're not suggesting paths that are too
long (cause too many dupes or collisions). My only concern with even them
is possible "reduced throughput" for all the users.

While the WIDEn-N convention, of course, has been to use the same number
for n and N (in order to assist the listener know the number of hops used
by the sender), the n can be set to any number from 1 to 7. It's only the
N that actually determines the number of hops a packet takes (at least in

current Kantronics WIDEn-n digis).
